*Seek, Strike, and Destroy:
U.S. Army Tank Destroyer Doctrine
in World War II*

FOREWORD

In the seventy years that have passed since the tank first appeared, antitank combat has presented one of the greatest challenges in land warfare. Dramatic improvements in tank technology and doctrine over the years have precipitated equally innovative developments in the antitank field. One cycle in this ongoing arms race occurred during the early years of World War II when the U.S. Army sought desperately to find an antidote to the vaunted German blitzkrieg. Against the frenzied background of global war, a small group of professional officers devised the tank destroyer as the Army's answer to the tank.

This *Leavenworth Paper* analyzes the origins of the tank destroyer concept, evaluates the doctrine and equipment with which tank destroyer units fought, and assesses the effectiveness of the tank destroyer in battle. To the professional soldier of the 1980s, the tank destroyer experience yields some important lessons concerning the pitfalls of formulating doctrine. The thoughtful reader will also gain some specific insights into the problem of antitank warfare, a consideration that is as vital to the U.S. Army today as it was half a century ago.

Introduction

On 3 December 1941, the War Department inaugurated a military concept unique to the U.S. Army—the tank destroyer. The term “tank destroyer” (TD) evolved into a broad concept that included personnel, equipment, and units alike. Born of a desperate need to counter the mechanized might of the so-called blitzkrieg, tank destroyer doctrine involved the pooling of anti-tank weapons into battalions at the division echelon and higher and the massing of those battalions, when needed, into regimental-size groups or even brigades. Specially developed tank destroyer weapons incorporated great mobility and high firepower at the expense of armor protection. Tank destroyer personnel were imbued with an aggressive, elite spirit intended to counter the tank’s psychological ascendancy on the battlefield. The tank destroyer motto—Seek, Strike, and Destroy—emphasized that tank destroyers were not to await enemy tank attacks passively in the manner of traditional antitank forces but were to seize the initiative and take the battle to the enemy. The tank destroyer shoulder patch, depicting a black panther crushing a tank in its jaws, symbolized the “TD” spirit.

The tank destroyer establishment came into being with the blessing of the Army Chief of Staff, George C. Marshall, and for a while seemed likely to take its place as a full-fledged arm of the service. However, on the battlefields of North Africa and western Europe, tank destroyers never lived up to expectations. Advocates of the tank destroyer concept have explained this failing by pointing out that the Germans rarely employed massed armor in the late stages of the war, thus precluding the need for a major antitank capability. In addition, most tank destroyer units employed expedient weapons that could not execute the principles of tank destroyer doctrine. Finally, apologists have noted that higher commanders tended to misuse the tank destroyers assigned to them by breaking up the TD battalions and utilizing the fragments in missions other than the aggressive, antiarmor role.

While each of these explanations for the failure of the tank destroyer concept has validity, none of them reaches the core of the problem: tank destroyer doctrine was fundamentally flawed. It is the purpose of this paper to show that the creators of the tank destroyer concept formulated their doctrine with an imperfect understanding of combined arms mechanized

warfare and thus created a doctrinal solution for a problem that did not exist as perceived. Not surprisingly, field commanders who received tank destroyer units refused to implement a doctrine that failed to account for the realities of the World War II battlefield. The inflexibility of tank destroyer doctrine resulted in its abandonment and led to the employment of tank destroyers in extradoctrinal roles, albeit with a surprising degree of success. The flaws inherent in tank destroyer doctrine, rather than the misuse of tank destroyers by higher commanders or deficiencies in equipment, prevented the tank destroyers from fulfilling their intended role. That the tank destroyers performed yeoman service in spite of doctrinal defects is to the credit of the American soldiers who, in essence, created a new doctrine in the field.

Antitank Evolution

1918—1941

1

The advent of the armored fighting vehicle on the battlefields of World War I symbolized the beginning of a new age in ground warfare. The first tanks were clumsy, unreliable, difficult to operate, and capable of only limited participation in a combined arms team. Nonetheless, advocates of the tank believed that it possessed the capability to restore decisive maneuver to the trench-bound battlefield. First introduced by the British in the Battle of the Somme (1916), tanks eventually found their way into French and American armies as well.

The appearance of tanks in the Allied order of battle prompted the Germans to develop special means of countering them. German troops found that the lumbering British and French tanks were relatively immune to small-arms fire, but that no tank could survive a direct hit from artillery. Thus, the Germans employed 77-mm field guns in their forward defensive zones to serve in both antitank and close support roles. Some divisions maintained "flying squads" of 77-mm guns as a mobile antitank reserve. The Germans also developed a special armor-piercing rifle round and even designed a 13-mm antitank rifle.¹

Inasmuch as the Germans manufactured only about twenty combat-worthy tanks during World War I and utilized another dozen captured French and British models, the Allies felt no need to develop a specialized antitank capability. A British pamphlet on antitank measures that the U.S. War Department reprinted and distributed makes this clear: "It is not considered either practicable or necessary, at any rate for the present, to introduce any special anti-tank gun; our existing artillery resources are regarded as being fully adequate to deal with tanks."² Although small-arms fire, aircraft, friendly tanks, and obstacles should all be considered as anti-tank resources, "experience shows that artillery fire forms the most effective defence against tanks, and that all other arms and weapons can only be regarded as subsidiary means."³ The manual suggested that for antitank purposes artillery should be positioned in depth and should include mobile gun sections designated to reinforce threatened sectors at the first sign of an enemy tank attack,⁴ much in the manner of the German "flying batteries."

Significantly, the pamphlet made clear that the tank's sole purpose was to support the infantry, which constituted the main threat in any attack:

Tanks unaccompanied by infantry cannot achieve decisive success; they must be supported by infantry, who alone can clear and hold ground gained If the tanks succeed in penetrating the line, the [friendly] infantry must hold out and concentrate all their efforts on stopping the advance of the enemy's infantry, while the hostile tanks are dealt with by our artillery.

The defeat of the enemy's infantry must therefore be the first consideration in all plans for anti-tank defence.⁵

This 1918 pamphlet expressed two concepts that would become part of U.S. Army doctrine for the next twenty years. The first concept concerned the role of the tank. The 1920 amendment to the National Defense Act abolished the autonomous Tank Corps and assigned all tanks to the Infantry. A 1922 field manual stated unequivocally that the tank existed solely "to facilitate the uninterrupted advance of the rifleman in the attack."⁶ The second concept followed from the first: enemy attacks involving tanks could be countered by basically traditional means and did not necessitate a significantly specialized response.

Events in Europe during the interwar years did little to alert the U.S. Army to the growing threat posed by the tank. The largest European conflict of that period, the Spanish Civil War, witnessed the employment of tanks, but without decisive results. Some early antitank guns, in combination with traditional measures and expedients such as the Molotov cocktail (a hand-thrown incendiary device), seemed equal to the task of stopping the tank. Following that war, tank designers in Europe significantly upgraded tank capabilities, whereas antitank developers foundered in complacency.⁷

During the interwar period, great strides were also made in the evolution of tank doctrine. The British Army, prompted by such theorists as J. F. C. Fuller and B. H. Liddell Hart, was the first to experiment with large-scale mechanized forces, until budgetary and other constraints curtailed the continued development of armor doctrine. In Germany, the rearmament program instigated by Adolf Hitler in 1935 brought Heinz Guderian the opportunity to create the first panzer (tank) divisions, which would in time constitute the major challenge to American antitank capabilities. The panzer division was much more than just a force of massed tanks; it was a combined arms team centered around the tank. Each division included a panzer brigade, a motorized infantry brigade, a motorized artillery regiment, plus motorized reconnaissance, engineer, antitank, and antiaircraft battalions. Thus, the panzer division was capable of close integration among the arms, but at the *tank's* level of mobility, not that of the infantryman. Moreover, the panzer division could be broken down into combined arms battle groups, each one task-organized to fulfill a particular mission in combat. Guderian advocated the use of massed panzer divisions to strike at strategic objectives deep in the enemy rear.⁸

Compared to German interwar developments in armor, American progress in the field of antitank warfare lagged badly. Even so, the problem of

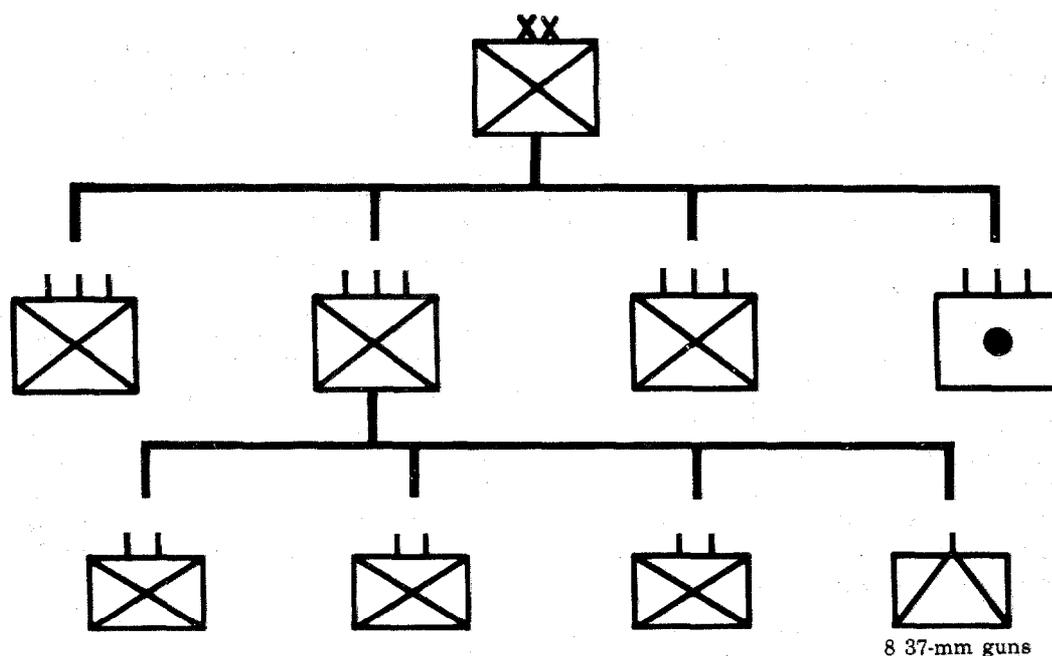

Figure 1. Proposed infantry division, 1938

stopping the tank was not completely ignored. The 1937 field tests undertaken by the 2d Division resulted a year later in recommendations that the Army adopt a triangular (three-regiment) infantry division as its basic fighting formation (see figure 1). The recommendations included placing an eight-gun antitank company in each regiment.⁹ Although two years would pass before the War Department acted on those proposals, the 1937 tests had a profound effect upon Brigadier General Lesley J. McNair, 2d Division's chief of staff and director of the tests. McNair was destined to become intimately involved with both the organization of the U.S. Army for war and the development of its antitank policies.

In another positive development, the Command and General Staff School at Fort Leavenworth published, for instructional purposes, a comprehensive antitank manual. First appearing in 1936 as *Antitank Defense (Tentative)*, it was revised in 1939 and retitled *Antimechanized Defense (Tentative)*. *Antitank Defense* postulated the existence not only of regimental antitank companies similar to those proposed as a result of the 1937 division tests but also a divisional antitank battalion. The manual advocated an antitank defense-in-depth with the regimental antitank elements providing protection to the frontline troops and the antitank battalion guarding the division's flanks, protecting noninfantry elements, or reinforcing the regimental antitank forces, according to the situation. A fundamental premise of the manual was that the divisional antitank battalion must remain grouped and intact, to be massed where the tank threat was greatest. *Antitank Defense* proposed that antitank elements, especially the

Lesley J. McNair, director of 1937 Army field tests and later the head of AGF

divisional battalion, should be motorized and provided with reconnaissance assets so that a minimum of forces would be tied down to routine tasks, freeing the maximum possible forces to be held in readiness to meet the unexpected (see figure 2).¹⁰ The antitank doctrine expressed in *Antitank Defense* was sound, clearly expressed, and feasible, if implemented with adequate weapons. Although not an official part of Armywide doctrine, *Antitank Defense* served as the basis for antitank instruction at the Army's highest tactical school. The commandant of the Command and General Staff School who authorized the 1939 revision entitled *Antimechanized Defense* was none other than General McNair.

The Army's official doctrine, as expressed in the 1939 *Field Service Regulations*, conformed in general to the precepts of *Antitank Defense*. Although the regulations perpetuated the World War I concept of utilizing artillery, aviation, friendly armored vehicles, and mines as antitank assets, it also specified that "the antitank cannon is of first importance in anti-mechanized defense. . . ."¹¹ It adopted the premise, found also in *Antitank Defense*, that local defense was the task of organic regimental antitank elements, and that the protection of the command as a whole was the responsibility of yet-to-be-created antitank units controlled by higher headquarters.¹²

Thus, by 1939, Army antitank doctrine included some sound fundamental principles, even though the Army had yet to establish the antitank units themselves. Nor did the Army possess a real antitank gun when *Antitank Defense* and the 1939 *Field Service Regulations* were written. In planning for fiscal year 1939, the general staff made a conscious decision to

forego normal research and development procedures in order to procure some kind of existing antitank weapon immediately. As a consequence, the Ordnance Department found itself responsible for producing a copy of the German PAK 36, a 37-mm antitank weapon that was already nearing obsolescence. Production of the American version (which was undertaken without regard to patents or licensing laws) began in early 1940 and yielded some 2,500 weapons by the time the United States went to war.¹³ Meanwhile, .50-caliber machine guns and antiquated field guns of 37-mm and 75-mm would also be pressed into antitank service.¹⁴

Germany's invasion of Poland on 1 September 1939 signaled the beginning of World War II and alerted the world to the potential of mechanized forces. Six panzer divisions spearheaded the pincers that enveloped and crushed the Polish Army in its frontier positions and brought the campaign to a close within a month. Western analysts were impressed by the so-called blitzkrieg, but most shared the attitude of the French high command that German successes of such magnitude were unlikely to be repeated against a first-rate opponent.

In the United States, the outbreak of war in Europe occasioned the beginnings of rearmament. General George C. Marshall, who became Army Chief of Staff on the same day that the war began, ordered the Army to adopt the triangular division that had been tested in 1937. As implemented in 1939, the triangular division's antitank assets were limited to twenty-four antitank guns under the control of division artillery.¹⁵ This action raised the question of which arm was responsible for antitank combat, inas-

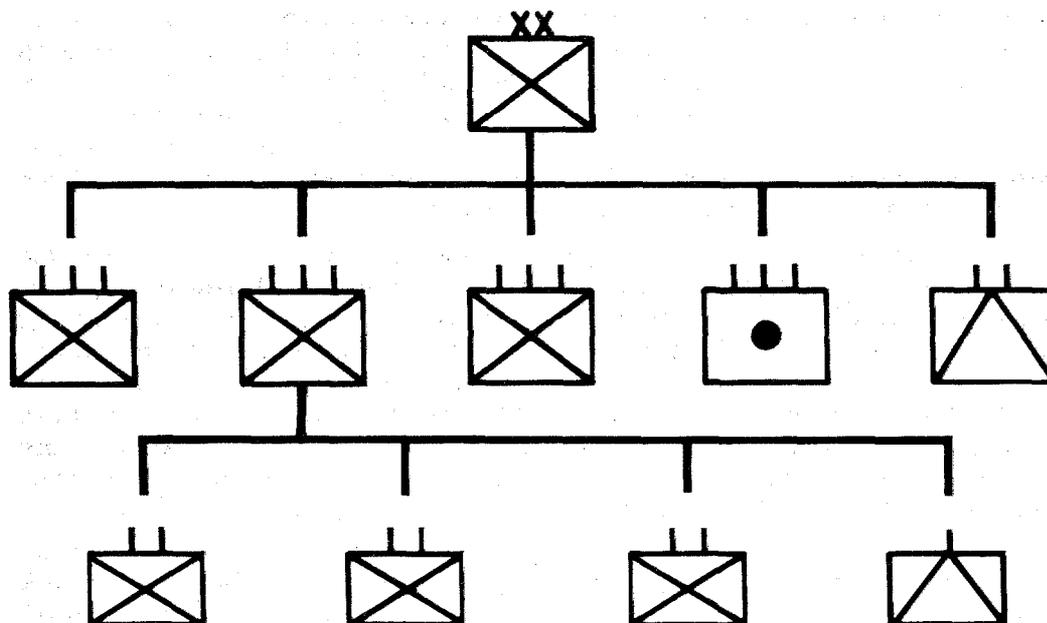

Figure 2. Antitank Defense proposal, 1936

much as the *Field Service Regulations* stated that antitank defense was primarily the concern of the Infantry.¹⁶ The division of authority between Infantry and Field Artillery paralyzed the development of American antitank capabilities just when the need for haste was becoming manifest.

If any event could have galvanized the Army into seeing after its antitank capabilities, it should have been the stunning defeat of France in the spring of 1940. At this time, the German armed forces enjoyed no significant superiority in numbers of divisions over the western Allies (about 140 each) and were actually inferior in numbers of tanks (approximately 2,200 to 3,000).¹⁷ However, the bulk of the Allied tanks were scattered by battalions along the front for World War I-style infantry support, whereas the German armor was gathered together into ten panzer divisions.

French antitank doctrine was unequal to the task of stopping massed panzers. The French clung to the World War I tenet that the tank existed to support the infantry and failed to consider the significance of a panzer division predicated upon massed tanks. Accordingly, French antitank doctrine called for the frontline infantry to allow the enemy tanks to pass by and then to rise up and engage the enemy infantry, which supposedly constituted the true threat. Meanwhile, the enemy tanks, meaningless without their infantry, would be destroyed by antitank guns organized in three echelons.¹⁸

The 37-mm antitank gun, the Army's first specialized antitank weapon

French faith in the antitank gun was absolute. To quote a French field manual, "At the present time, the antitank gun confronts the tank, as during the last war, the machine gun confronted the infantry."¹⁹ Each French infantry division possessed fifty-eight antitank guns, yielding a ratio of ten

antitank guns per kilometer of front. The French calculated that this concentration could cope with fifty enemy tanks per kilometer.²⁰

Unfortunately, the main German panzer thrusts that crossed the frontier in 1940 struck at selected spots with concentrations of up to one hundred tanks per kilometer. Seven of the ten panzer divisions sprang through the Ardennes forest and shattered the weakest sector of the Allied front, along the Meuse River. Task-organized into battle groups, the massed panzer divisions punched through the linear French defenses and pressed on to reach the English Channel within two weeks of the start of the campaign. The pace of the panzer advance prevented the Allies from regaining their equilibrium or restoring a front line. Due largely to the efforts of the panzer divisions, the finest elements of the British and French Armies were either destroyed or pinned against the sea. Final defeat and capitulation of the French nation followed within a month.

The destruction of the French Army, widely regarded as the finest in western Europe if not the world, shocked Americans as the defeat of Poland had failed to do. Congress authorized the induction of the National Guard and Reserves in August and in September passed the nation's first peacetime selective service act. The Army implemented its Protective Mobilization Plan, which involved the activation of four full field armies headed by a general headquarters (GHQ). The GHQ chief of staff, who was responsible for organizing and training the ground forces, was Brigadier General McNair (McNair would become a lieutenant general within a year).

To Americans, it seemed clear that the principal agent of the Allies' demise had been the German panzers. The underestimation of armored warfare that had prevailed in the U.S. Army was displaced by an exaggerated fear of the tank that overlooked Allied strategic blunders in France and obscured the combined arms nature of the panzer division. A survivor of the French collapse reported simply that "the main cause of our failure to hold the Germans was the lack of efficient and sufficiently numerous anti-tank weapons. . . . Could the tanks have been stopped, the whole blitz would have crumbled."²¹ Reports had it that 6,000 German tanks had simply inundated the French and British.²² *Field Artillery Journal* maintained that some of these panzers were monsters of seventy tons,²³ more than three times the actual weight of the largest German tank in 1940.

American officers had cause for alarm, if not desperation, for as late as the summer of 1940, few of the artillerymen charged with antitank defense had ever seen a tank in action, let alone a mechanized formation, nor had they ever fired their inadequate weapons at a fast-moving target.²⁴ The assumption took hold that the infantry division was helpless in the face of a panzer attack, and some artillery officers discussed antitank combat in terms of last-ditch fighting by isolated antitank batteries.²⁵ The *Field Artillery* apparently assumed that its antitank guns were intended for the defense of the artillery and not of the division as a whole.

Although individual officers had become greatly concerned with the problem of stopping the tank, official reaction to the panzer triumph in

France was somewhat less than wholehearted. In the autumn of 1940, infantry regiments in a division were at last authorized an antitank company apiece.²⁶ These three companies, plus the existing antitank elements under division artillery, raised the triangular division's antitank complement from twenty-four to sixty-eight guns, only ten more than the number of pieces found in the discredited French division. The War Department issued a training memo on 23 September that recommended posting a minimum of antitank assets in the front line and holding the majority of guns in mobile reserve.²⁷ The new *Field Service Regulations* published in early 1941 reemphasized the importance of maintaining a defense-in-depth:

Employment of antitank guns is based on a minimum of guns in position initially to cover obstacles and as a first echelon of defense, and a maximum of guns as a mobile reserve. Based on information of hostile mechanized forces, reserve guns are moved rapidly to previously reconnoitered locations and so disposed in depth as to permit timely and powerful reinforcement of areas threatened by hostile mechanized attack.²⁸

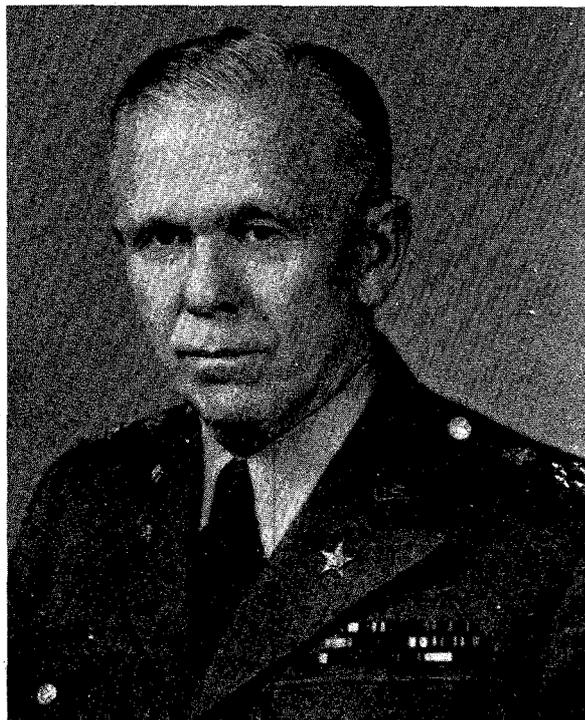

In fact, *Field Service Regulations* of 1941 had little more to offer on antitank warfare than had the 1939 edition. The scheme proposed in *Antitank Defense*, with its divisional antitank battalion backing up the regimental antitank companies, remained superior to official doctrine.

In terms of actually creating competent and confident antitank units, little was accomplished in late 1940 and early 1941. The disorders resulting from the induction of civilian components hindered training of all sorts, as did the shortage of adequate equipment. Much antitank training took place with simulated weapons. The most serious problem was the continued division of branch authority over antitank matters. Neither Infantry nor Field Artillery embraced the antitank task as its own, meaning that there was no one agency to pursue doctrinal developments or provide training guidance to the field units. So far as the War Department knew, VI Corps was the only higher headquarters in the entire Army that issued any antitank training instructions.²⁹

On 12 April 1941, General McNair was moved to remark: "It is beyond belief that so little could be done on the [antitank] question in view of all that has happened and is happening abroad. I for one have missed no opportunity to hammer for something real in the way of antitank defense, but so far have gotten nowhere. I have no reason now to feel encouraged but can only hope this apathy will not continue indefinitely."³⁰

The Operations and Training Division (G3) of the War Department General Staff, headed by Brigadier General Harry L. Twaddle, made an attempt to break the logjam by hosting an antitank conference on 15 April. In attendance were representatives from Infantry, Field Artillery, Armored Force, Cavalry, Coast Artillery, GHQ, and War Plans Division. In general, the attendees concurred on the need to expedite the development of antitank capabilities and agreed that divisional antitank battalions would soon be authorized, but the conference failed to establish a consensus as to which

General of the Army George C. Marshall, who was deeply involved in pre-World War II force development

arm should be responsible for antitank developments. The Infantry representative stated that his arm should continue to administer to antitank defense because it possessed the "essential background and experience"—a curious argument when one considers the Infantry's unimpressive record of antitank development. Field Artillery claimed an interest on the grounds that it controlled the weapons most suitable to antitank combat. (In fact, anti-aircraft guns, which came from Coast Artillery, not Field Artillery, would prove to be the best interim antitank weapons.) Cavalry also entered a bid for antitank responsibility, believing itself a branch that could "readily adapt itself to assuming what promise[d] to become a larger and larger task." (In other words, Cavalry was an arm in search of a mission, due to the refusal of its current chief to admit that the day of the horse had passed.) The Armored Force perceived antitank defense to be antithetical to its offensive philosophy and declined any interest in assuming responsibility. GHQ testified that the number of antitank guns in existing formations was adequate, but that their dispersal among several echelons rendered them ineffective. To remedy this situation, GHQ proposed that all antitank elements be removed from the line units and concentrated under a separate GHQ Antitank Force. In the end, G3 recommended to the Army Chief of Staff, General Marshall, that Infantry exercise jurisdiction over antitank matters until such a time as an official armored arm was established, whereupon Armor would assume responsibility, presumably whether Armor wanted to or not.³¹

General Andrew D. Bruce, head of the Planning Branch, a think tank for antitank warfare

At this juncture, General Marshall's patience ran out. A year earlier, he had reached the same impasse with regard to mechanized forces. His response in 1940 had been to withdraw all tanks from the existing arms and place them under the authority of a new "quasi-arm," the Armored Force. Marshall opted for a similar policy with antitank matters. On 14 May 1941, he instructed G3, War Department General Staff, to bypass the arms and assume the lead in antitank development:

At the risk of placing G-3 in the operating field, I believe that for the solution of this problem you should take energetic and positive steps to push this matter as fast as humanly possible. The subject should be attacked with imagination and untiring effort. I believe that it is a function of the General Staff and should be carried through in your office. I do not want the question of another branch or arm brought up at this time.³²

General Marshall went on to direct that G3 establish "a small planning and exploring branch" to study unsolved problems such as antitank warfare. G3 activated the Planning Branch on the following day, placing Lieutenant Colonel Andrew D. Bruce in charge.

Eleven days after its inception, Bruce's Planning Branch held a small antitank conference of its own. The conferees reaffirmed the need for a divisional antitank battalion (to be formed out of division artillery's antitank battery and platoons) to complement the regimental antitank companies. Accordingly, on 24 June 1941, the War Department ordered the prompt activation of an antitank battalion in each division, in time for

participation in summer maneuvers.³³ Thus, the scheme first advanced in 1936 by *Antitank Defense* was at last realized: antitank companies in the regiments would be backed up by an antitank battalion under division control.

The antitank battalions activated by the divisions during the summer of 1941 varied considerably in composition. This was due, in part, to the fact that National Guard divisions remained in the four-regiment "square" configuration and did not adopt the "triangular" format until after Pearl Harbor (see figure 3). Typically, the battalions consisted of three to five batteries withdrawn from division artillery and were equipped with various mixes of 37-mm, 75-mm, and simulated guns.³⁴

By 1941, however, *Antitank Defense* was no longer the latest word in countering armor. Major (later General) Albert C. Wedemeyer, a graduate of the German *Kriegsakademie*, proposed another train of development in an article published simultaneously by *Infantry Journal* and *Field Artillery Journal*. Given the tendency of German panzer divisions to mass rapidly against a selected point of the defender's line, Wedemeyer considered it vital that antitank forces also be capable of concentrating in critical areas of the front. "The bulk of antitank units [should] therefore [be] pooled in G.H.Q.," held in highly mobile, centrally located three-battalion groups, and attached to the field armies and corps threatened by tank attack. He proposed that the primary weapon of these formations should be mobile, heavily gunned "tank chasers." Wedemeyer suggested that medium tanks might fill that role.³⁵

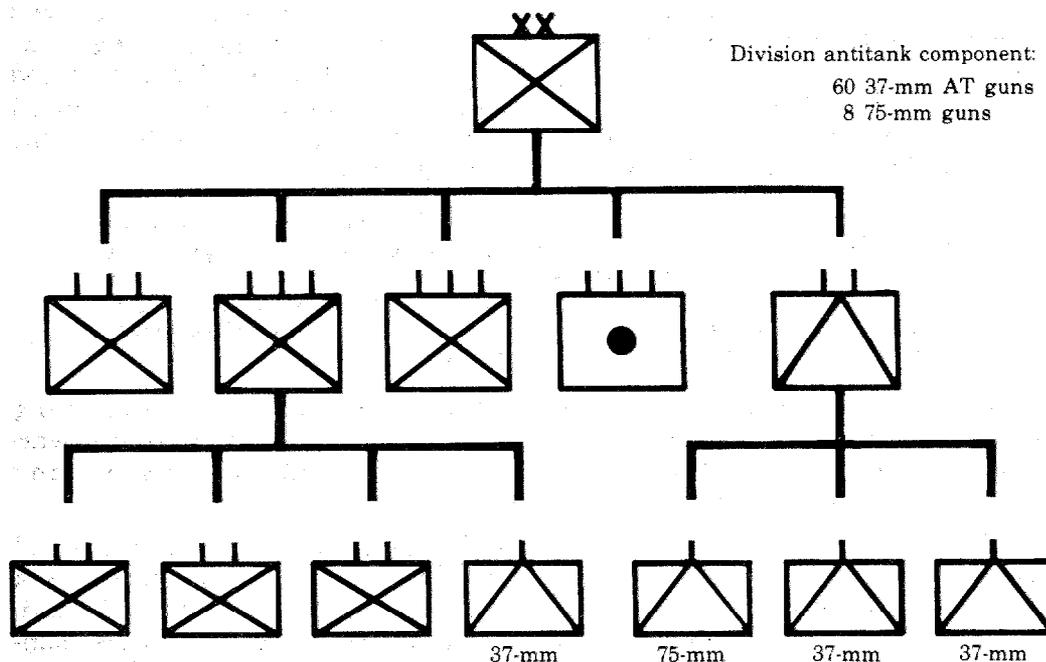

Figure 3. Triangular division, 1941 maneuvers

As early as 14 April 1941, General Marshall began thinking along similar lines. On that date, he issued a memo to G3, War Department General Staff, directing that "prompt consideration be given to the creation of highly mobile antitank-antiaircraft units as Corps and Army troops for use in meeting mechanized units. These units to be in addition to organic antitank weapons."³⁶ The representatives at the 15 April conference, as well as Bruce's Planning Branch, anticipated that such formations would indeed be established.³⁷

The concept of gathering antitank assets to the upper echelons was very compatible with the policy of "streamlining and pooling" that underlay the U.S. Army's organization for World War II. Streamlining and pooling aimed at making the triangular division as lean as possible by removing any assets not needed for the division's basic mission and pooling those assets at higher echelons, from which they could be attached to the division according to prevailing combat conditions. This policy applied especially to antitank and antiaircraft formations that were inherently defensive in character.³⁸

The concept of maintaining powerful upper-echelon antitank units can be viewed as a logical extrapolation of the *Antitank Defense* system. Just as *Antitank Defense's* divisional battalion supported the regimental antitank companies, so, too, would the corps, field army, and GHQ antitank units backstop the divisional antitank forces.

General McNair was a firm believer in streamlining and pooling, as well as in active antitank defense. On 8 August 1941, he directed Third Army to organize three provisional GHQ antitank groups (regiment-size formations) for participation in the autumn army-versus-army maneuvers (see figure 4). As raw material, Third Army utilized four 37-mm antitank battalions and five 75-mm battalions drawn from various artillery units. Each group consisted of three antitank battalions, a scout car platoon for reconnaissance, three engineer platoons, and three rifle platoons. The groups, which would be attached at the field army echelon, were trained to fulfill an "offensive role" that included vigorous reconnaissance, rapid movement to contact armored units before their tanks could deploy, and the destruction of enemy armor with massed gunfire.³⁹

During September, Second Army faced Third Army in the largest field exercises in the nation's history. Second Army controlled I Armored Corps (two armored divisions) in the opening maneuver, and Third Army commanded the three GHQ antitank groups (in addition to the antitank forces in each division). At nearly every turn, the armored forces found themselves frustrated by antitank guns, a development that General McNair noted in his after-action critique: "An outstanding feature of the maneuver was the success attained in antitank defense, due primarily to guns. While terrain hampered armored operations, it seems clear that the mobile antitank gun defense now being developed gives promise of marked success."⁴⁰

The results of tank-versus-antitank exercises were not as clear as General McNair implied. Significantly, only one battalion out of the three

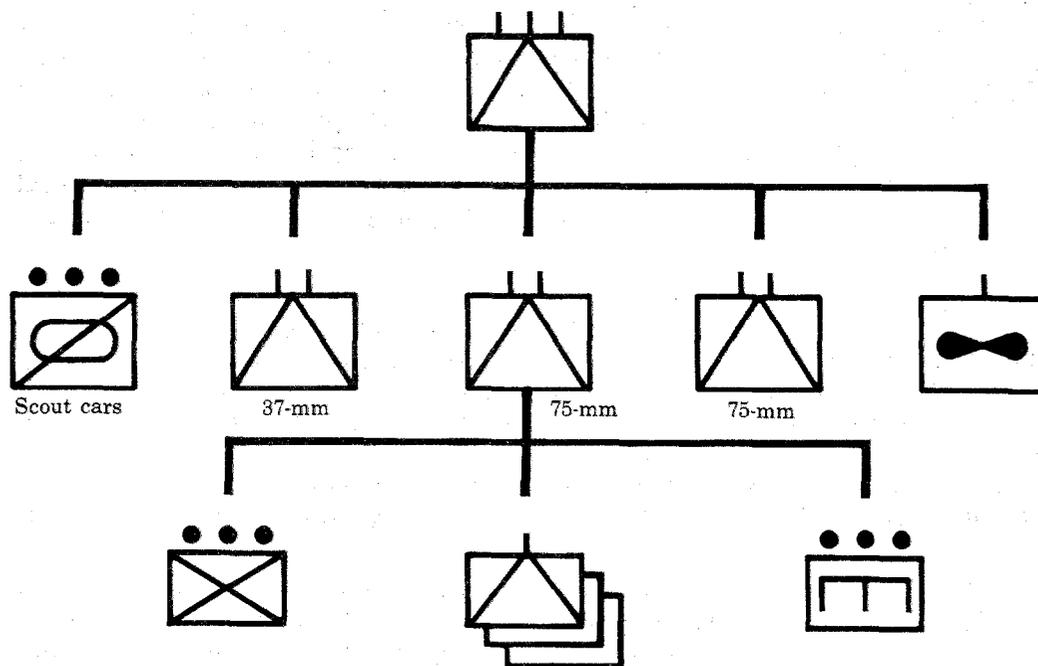

Figure 4. GHQ antitank group, 1941 maneuvers

antitank groups participated in a major antitank action during the two weeks of maneuvers. The vast majority of tanks "destroyed" fell to the antitank units organic to the divisions, not to the mobile groups. In addition, armored force personnel were quick to point out that the maneuvers' rule book was slanted in favor of the antitank, granting 37-mm guns and even .50-caliber machine guns an unwarranted degree of effectiveness against armor. The rules also stated that the only way a tank could "destroy" an antitank gun was by "overrunning" it, a dangerous proposition, indeed, given the exaggerated effectiveness of antitank weapons as prescribed by the rules. Observers noted that armor's doctrinal deficiencies, particularly its tendency to operate in all-tank formations, were as much as anything responsible for armor's frustration. They also reported that faith in the mobile antitank groups was lacking.⁴¹ In sum, the Louisiana maneuvers demonstrated, if anything, the value of divisional antitank assets fighting in a relatively static mode and the need for the Armored Force to rethink its doctrine and force structure. In spite of General McNair's enthusiasm, the mobile antitank groups did not prove themselves in Louisiana.

The Carolinas maneuvers of November 1941 provided another tank-antitank test. Red Army (IV Corps) commanded I Armored Corps and its two armored divisions. Blue Army (First Army) received the three GHQ antitank groups and organized three more of its own: Tank Attacker-1 (TA-1), TA-2, and TA-3. TA-1, the most powerful of the three, included 93d Anti-

tank Battalion, a provisional formation armed with experimental self-propelled guns (obsolete 75-mm field pieces mounted on half-tracks). Other elements of TA-1 included an infantry battalion, a field artillery regiment, a separate antitank company, a tank company, engineers, antiaircraft guns, and observation aviation, which made TA-1 a powerful, combined arms force in its own right (see figure 5). First Army directed that "the action of the detachment [TA-1] will always be offensive, moving to meet hostile threats and to destroy hostile forces before they can have decisive effect on the Army's operations."⁴²

TA-1 had its moment of glory on 20 November when it received orders to destroy the Red 69th Armored Regiment which, in company with Headquarters, 1st Armored Division, was stranded miles behind Blue lines near Albemarle, North Carolina. Supported by one of the GHQ antitank groups, TA-1 attacked the armored bivouac at 0615, just as the tanks were organizing a breakout attempt. Blue antitank guns quickly positioned themselves along every escape route and easily "destroyed" the Red tanks attempting to overrun them. Lacking infantry, the 69th could do little but charge the antitank guns with their tanks. The 93d Antitank Battalion drove its self-propelled weapons directly into the bivouac with guns blazing. The 69th disintegrated, forcing the division commander to flee in a liaison aircraft.⁴³

Blue antitank forces as a whole performed better in the Carolinas maneuvers than they had in Louisiana. In one six-day exercise, the two Red armored divisions "lost" 844 tanks, 82 more than their combined tables of organization called for. (Tanks "destroyed" in the maneuvers each day returned to action at midnight.)

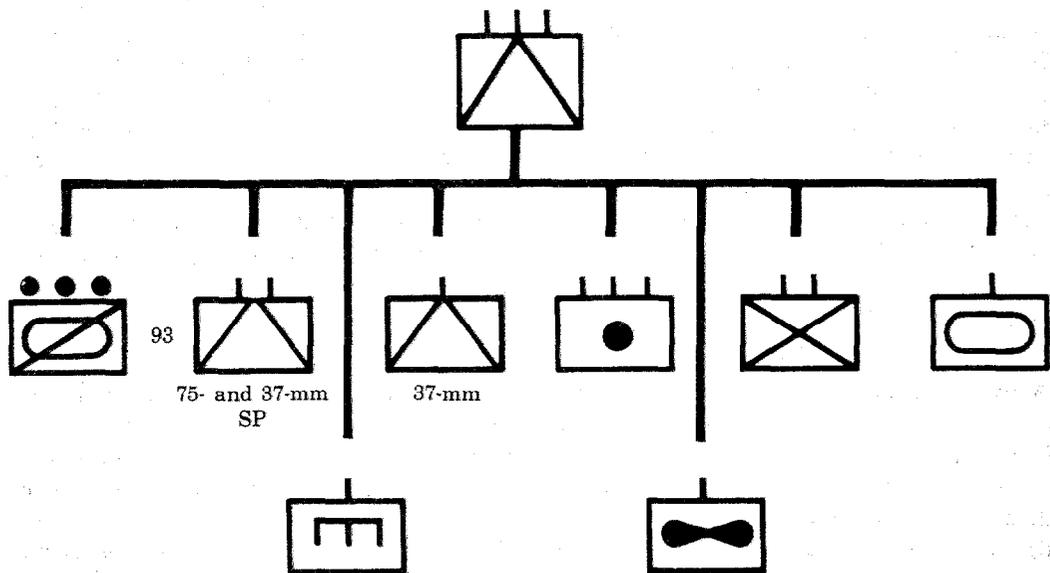

Figure 5. Tank Attacker Detachment No. 1, Carolinas maneuvers, 1941

Once more, however, a complete explanation of armor's problems in the Carolinas maneuvers involved far more than the antitank units it faced. As one observer noted, "It is believed success of AT units due to piecemeal [armored] attacks . . . rather than to AT units' effectiveness."⁴⁴ Of the experimental 93d Antitank Battalion, an observer report disclosed: "Its success in operations was the result of improper employment of armored units and the energy shown by its commander rather than from a proper conception of its employment on the part of higher unit commanders. . . ."⁴⁵ Observers noted repeatedly that the lack of sufficient infantry in armored units was a principal factor behind the high tank losses. The head of the Armored Force, Major General Jacob L. Devers, was even more succinct: "We were licked by a set of umpire rules."⁴⁶

The Armored Force took its embarrassment to heart and, following the maneuvers, developed a new divisional organization that increased the proportion of infantry to tanks and significantly improved armor's capability to fight in balanced, combined arms teams. Antitank forces, having won an apparent victory in the maneuvers, would not undergo a similar critical reappraisal.

On 3 December 1941, Generals Marshall, McNair, and others met with the Secretary of War to discuss the lessons learned in the autumn maneuvers. McNair pointed out that the Armored Force, which had admittedly been mishandled on occasion, failed to achieve decisive results against the Army's new antitank forces. He recommended that the development of antitank forces be stressed.⁴⁷

In fact, the War Department had already charted out an enormous antitank program. On 18 August, Lieutenant Colonel Bruce of the Planning Branch released an estimate, based on a fifty-five-division army, calling for 220 antitank battalions: 1 organic to each division, 55 pooled at corps and field army echelons, and 110 battalions as GHQ troops.⁴⁸ With four antitank battalions for each division, this program would have committed roughly one-fourth of the Army's ground fighting elements to the antitank role! A meeting in General Marshall's office on 7 October approved four battalions per division as a planning estimate and suggested the immediate activation of sixty-three battalions. Perhaps the most far-reaching result of this meeting was the decision to rename antitank battalions "tank destroyers," for psychological reasons.⁴⁹

The date 27 November 1941 was a watershed in the history of the Army's antitank forces. A War Department letter of that date ordered the activation of fifty-three tank destroyer battalions under the direct control of GHQ, not of the line units. A further directive of 3 December removed all existing antitank battalions from their parent arms, redesignated them tank destroyer battalions, and placed them under GHQ as well.⁵⁰ Battalions withdrawn from infantry divisions received numbers in the 600s, those from armored divisions in the 700s, and those from field artillery units in the 800s. (The 93d Antitank Battalion of Albemarle fame, for example, became the 893d Tank Destroyer Battalion.)⁵¹

The letter of 27 November also ordered the activation of a Tank Destroyer Tactical and Firing Center under War Department supervision. Lieutenant Colonel Bruce, late of the Planning Branch, took command of the center when it commenced operations at Fort Meade, Maryland. The center's role was to serve as a developmental agency for doctrine and equipment and to provide centralized training for tank destroyer personnel and units.⁵²

The significance of these developments was profound. By creating what amounted to a new arm of the service, the War Department surmounted the lethargy and apathy that had existed in the present arms and had stunted progress in the antitank field for so long. Also, by centralizing authority for antitank matters, the War Department assured the systematic development of tank destroyer doctrine, equipment, and training.

On the other hand, the directives of 27 November and 3 December eliminated the divisional antitank battalions by converting them into GHQ tank destroyer battalions. This left the division with the regimental antitank companies as its only organic antitank assets. The 1941 maneuvers had clearly and repeatedly proven the value of the divisional battalions, whereas the GHQ antitank forces had yet to conclusively demonstrate their worth against a doctrinally sound armored force. Moreover, the creation of a tank destroyer quasi-arm eliminated day-to-day contact between the Army's antitank forces and the other arms. The tank destroyers would develop their doctrine and train in relative isolation. Throughout its existence, the tank destroyer establishment would suffer from the ambiguity of its relationship to the rest of the Army.

The tank destroyer was born without an established doctrine or adequate equipment. Unknown to its creators, the tank destroyer force had less than a year to come of age before being thrust into combat.

The Synthesis of Tank Destroyer Concepts

2

The year 1942 saw the tank destroyer program come to fruition. The accomplishments of that year included the finalization of official tank destroyer tables of organization, the formulation of a tank destroyer doctrine, the development of specialized tank destroyer equipment, and the establishment of training facilities and programs for tank destroyer personnel. By the end of the calendar year, tank destroyer forces were engaged in battle.

Two agencies were primarily responsible for the rapid development of the tank destroyer concept. One of these was Army Ground Forces (AGF), which on 9 March 1942 supplanted GHQ as the primary organization responsible for organizing and training ground combat elements. Lieutenant General McNair, by this time acknowledged as the father of the tank destroyers, commanded AGF. Thus, McNair bore the ultimate responsibility for tank destroyer organization, doctrine, and training.¹ The second agency involved was the Tank Destroyer Tactical and Firing Center under Colonel Bruce, which did the actual work of drawing up organizational charts, preparing field manuals, and training the tank destroyer troops.

One of the fundamental assumptions underlying the tank destroyer concept as it emerged in 1942 was the idea that stopping the tank had become a special problem that demanded a specialized response above and beyond general defensive measures. To General McNair, the solution to this problem was clear:

The tank was introduced to protect against automatic small arms fire, which was developed so greatly during and since the [First] World War. Its answer is fire against which the tank does not protect—the antitank gun. That this answer failed [against the Germans in 1940] was due primarily to the pitifully inadequate number and power of French and British antitank guns, as well as their incorrect organization.²

McNair emphatically believed that the antidote to the tank was *not* one's own tanks: "Certainly it is poor economy to use a \$35,000 medium tank to destroy another tank when the job can be done by a gun costing a fraction as much. Thus the friendly armored force is freed to attack a more proper target, the opposing force as a whole"³

Therefore, the task confronting Bruce and the Tank Destroyer Tactical and Firing Center was not simply one of finding a way to stop tanks, but

rather one of developing a mode of antitank combat that freed other friendly forces for offensive operations. To meet this challenge, the tank destroyer creators adopted mass, mobility, firepower, and aggressiveness as the qualities that would enable tank destroyer elements to fulfill their mission.

The first concrete accomplishment of the Tank Destroyer Tactical and Firing Center was the issuance of tables of organization for the tank destroyer battalion, which became the basic tank destroyer unit. Fortunately, a prototypical tank destroyer battalion had been in existence since the summer of 1941, in the form of the 93d Antitank Battalion (redesignated the 893d Tank Destroyer in December). Experience in field trials and in the Carolinas maneuvers, where the 93d constituted part of TA-1, led to certain refinements, such as the elimination of light tanks from the reconnaissance company and the addition of infantry for security against hostile infiltrators.⁴

With this work in hand, the Tank Destroyer Tactical and Firing Center was able to issue three tentative tables of organization on 18 December 1941. Two of these formations were light battalions armed with 37-mm guns, which Bruce considered to be expedient organizations dictated by equipment availability.⁵ The third type, designated the tank destroyer battalion, heavy (self-propelled [SP]), was Bruce's preferred formation and officially became the sole type of tank destroyer battalion on 5 June 1942 (see figure 6).⁶

The heavy, self-propelled tank destroyer battalion was a powerful formation comprising 35 officers and 807 enlisted men in its original configuration. (Incremental additions later raised the battalion establishment to an aggregate strength of 898.) It was led by a headquarters and headquarters company that consisted of a full staff plus communication, transportation, and motor maintenance platoons. The headquarters company was also the center for battalion supply. Serving as the battalion's eyes and ears was a reconnaissance company consisting of three reconnaissance platoons and a platoon of pioneers (a variety of combat engineers). The battalion's major fighting elements were its three tank destroyer companies, each of which commanded one platoon of light (37-mm) self-propelled guns and two of heavy (75-mm) self-propelled guns. Each platoon included two tank destroyer sections of two guns each, an anti-aircraft section of two guns, and a twelve-man security section. All told, the heavy, self-propelled tank destroyer battalion fielded twenty-four 75-mm self-propelled antitank guns, twelve 37-mm self-propelled antitank guns, eighteen self-propelled anti-aircraft guns, and 108 foot security troops.⁷

Inasmuch as antitank guns of the 37-mm type no longer appeared to be playing a significant role in the European war, the light platoon of the tank destroyer company was converted to a heavy platoon in a revised table of organization issued on 9 November 1942. The tank destroyer battalions that participated in the invasion of North Africa entered combat under the old organization.⁸

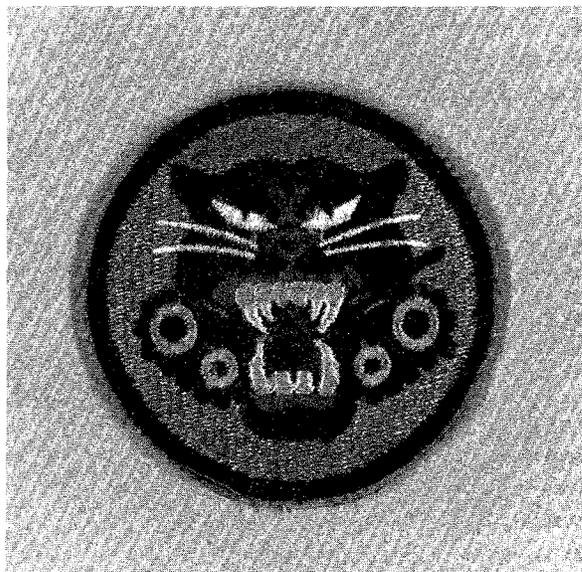

The Tank Destroyer Tactical and Firing Center also had antecedents to build upon when it turned to the codification of a tank destroyer doctrine in January 1942. During the 1930s, some officers, at least, had been instructed

suggested a cordon defense. They delegated defense of the front lines to the regimental antitank assets organic to the division.

Instead of a cordon, tank destroyer doctrine embraced the principle of a massed antitank reserve that was propounded by *Antitank Defense*, first published at the Command and General Staff School in 1936. Tank destroyer battalions and even larger groupings would be held out of the line, ready to respond to tank threats at the front, flanks, or rear.

Following the defeat of Poland and France, these pre-blitzkrieg antitank concepts, fundamentally defensive in nature, suddenly appeared to be inadequate in the face of the panzer division's offensive might. It may be a personality trait of the American officer that, when confronted by an enemy possessing unprecedented offensive power, he will turn to offensive power as the countermeasure. However that may be, starting in early 1941, the idea of stopping tanks by means of offensive antitank measures began to take root in the U.S. Army.

The aggressive spirit inherent in the early tank destroyer concept is exemplified by the famous black panther emblem

An early manifestation of this trend came at the 15 April antitank conference hosted by G3, War Department General Staff. Although the branches could not arrive at a consensus regarding advocacy for antitank development, the conferees reportedly did concur on the need to develop an offensive antitank capability.¹⁰ In the memo of 14 May with which he ordered the activation of Bruce's Planning Branch, General Marshall also called for an "offensive weapon and organization" to counter the tank.¹¹ General McNair concurred. In the closing remarks delivered at an antitank conference held in July 1941, he noted that in warfare, as in wrestling, "There ain't no holt what can't be broke." But armored warfare was one

such "holt"; breaking it required more than passive measures: "The counter-attack long has been termed the soul of the defense. Defensive action against a tank attack calls for a counterattack in the same general manner as against the older forms of attack There is no reason why antitank guns, supported by infantry, cannot attack tanks just as infantry, supported by artillery, has attacked infantry in the past."¹²

The 1941 GHQ maneuvers reinforced the trend towards offensive anti-tank tactics. In ordering the creation of three antitank groups for the maneuvers, McNair directed that "the role of GHQ antitank groups is twofold: offensive and defensive, of which the former is the more important and hence the one to receive the greater emphasis in training."¹³ First Army's specially developed antitank group, TA-1, was created with the understanding that "the action of the detachment will always be offensive . . ."¹⁴

In retrospect, it would seem probable that the "destruction" of the 69th Armored Regiment at the hands of TA-1 during the Carolinas maneuvers became the model tank destroyer operation in the minds of the men who drew up tank destroyer doctrine. In that action, TA-1 located an all-tank force behind friendly lines, hunted it down, and "destroyed" it without interfering with friendly offensive operations elsewhere. The 93d Antitank Battalion, which with its self-propelled weapons was TA-1's most powerful element, formulated training notes and standing operating procedures based on its experiences in maneuvers and on lessons gleaned from exercises with a tank battalion.¹⁵ Upon the activation of the Tank Destroyer Tactical and Firing Center in December 1941, the 93d, redesignated the 893d Tank Destroyer, became the center's first school troops. Its training notes went out to other battalions as guidance until official tank destroyer doctrine could be published. Its commander during the maneuvers, Colonel Richard G. Tindall, became the first commander of the center's unit training activity.¹⁶

In this manner, the idea of stopping tanks by means of offensive anti-tank measures, which originated among the Army's highest echelons, was apparently validated by some successful antitank actions in the maneuvers, even though many observers remained unconvinced. These doubters notwithstanding, the organization and offensive tactical procedures of the 93d Antitank Battalion became institutionalized throughout the tank destroyer establishment.

Unfortunately, this development sowed the seeds of future problems for the tank destroyers. For one, neither the German panzer divisions nor the U.S. Armored Force after 1942 conducted the sort of blindly aggressive all-tank operations that had set up the victory of TA-1 over the 69th Armored Regiment. Moreover, despite the official sanction given to offensive tank destroyer tactics, a significant body of opinion within the Army maintained, with justification, that antitank warfare was still intrinsically defensive in nature. Even General McNair wavered on this point. During the same speech in which he prescribed the counterattack as the centerpiece of antitank combat, McNair likened antitank forces to "seacoast defenses,"¹⁷ a comparison that could scarcely be construed to suggest offensive qualities. Further,

at the 7 October meeting in which the term "tank destroyer" was chosen for the new antitank service, McNair suggested that tank destroyer forces would "emplace and camouflage themselves" when faced by hostile tanks,¹⁸ a practice that would seem to be out of character with the prevailing offensive mindedness.

The disparity between the defensive realities of antitank warfare and the offensive language was not resolved. The publication of an official tank destroyer doctrine perpetuated the ambiguity. Only after tank destroyer units had experienced combat would a serious reappraisal take place.

Tank destroyer doctrine attained official status in the form of the War Department's FM 18-5, *Tank Destroyer Field Manual, Organization and Tactics of Tank Destroyer Units*. Work on FM 18-5 began in January 1942 at the Tank Destroyer Tactical and Firing Center. A prepublication draft was distributed to tank destroyer units on 19 March. The official publication date was 16 June, only six months after the writing began.

FM 18-5 opened with a statement that established the specialist nature of the tank destroyer: "There is but one battle objective of tank destroyer units, this being plainly inferred by their designation. It is the destruction of hostile tanks. Throughout all phases of training and during preparation for combat, this objective will be kept in mind by all ranks."¹⁹ The manual went on to describe the armored threat that the tank destroyers were created to meet. In many respects, that armored threat, as depicted in FM 18-5, was reminiscent of the U.S. Armored Force at the time of the 1941 maneuvers. For instance, the manual implied that light tanks constituted the major armored threat, just as light tanks predominated in the 1941 armored division. The manual portrayed tanks as operating in large masses that entered battle at top speed. It suggested that armored formations consisted of distinct tank, infantry, and artillery echelons, rather than the combined arms battle groups employed by the Germans (and adopted by the Armored Force in 1942). The tactics attributed to tanks included the overrunning of antitank guns, a practice thoroughly discredited in the 1941 maneuvers.²⁰

FM 18-5 did not deny that armored forces were combined arms formations. It warned that infantry and artillery operating in conjunction with tanks would attempt to suppress antitank fire.²¹ However, through means never fully spelled out, this cooperation among hostile arms would apparently be broken down, for FM 18-5 made it clear that tank destroyer units only engaged tanks.

FM 18-5 firmly embraced the concept of utilizing offensive operations to meet the tank threat:

Tank destroyer units are employed offensively in large numbers, by rapid maneuver, and by surprise. . . . Offensive action allows the entire strength of a tank destroyer unit to be engaged against the enemy. For individual tank destroyers, offensive action consists of vigorous reconnaissance to locate hostile tanks and movement to advantageous positions from which to attack the enemy by fire. Tank destroyers avoid "slugging matches" with tanks, but compensate for their light armor and difficulty of concealment by exploitation of their mobility and superior observation.²²

Tank destroyer forces would require special qualities: "The characteristics of tank destroyer units are mobility and a high degree of armor-piercing firepower, combined with light armor protection; strong defensive capacity against attacks of combat aviation; and flexibility of action permitted by generous endowment with means of communication."²³ These qualities had already been embodied in the battalion tables of organization and would also be reflected in the specifications developed for tank destroyer weapons.

Tank destroyer tactics as outlined in FM 18—5 built upon these same characteristics. Action would open with reconnaissance, which would begin early and be both continuous and extensive. The prescribed zone of responsibility for the tank destroyer battalion's reconnaissance company was a sector ten to twenty miles wide.²⁴ When enemy tank forces were located, the battalion's tank destroyer companies would hem in the enemy armor with surprise gunfire and maneuver against the flanks of the armored formation. In case of an encounter battle, the first tank destroyers to arrive on the scene were to engage the head of the enemy column, with subsequent tank destroyer elements maneuvering against flank and rear.²⁵

FM 18—5 placed more emphasis on the ambush than on the encounter battle. Ambush positions were to be selected prior to contact with hostile armor. Tank destroyer elements would be positioned in depth, disposed in a checkerboard of mutually supporting firing positions.²⁶ Tank destroyers would not be tied to those positions but would be free to maneuver, for each tank destroyer weapon would ideally have a number of firing and cover positions. After firing three or four rounds from one position, the weapon would displace to another before retaliatory fire could be brought to bear against it. Maneuvering tank destroyers would be covered by those in firing positions.²⁷

Obviously, FM 18—5 placed a high premium upon mobility and firepower for the successful execution of such operations:

Rapidity of maneuver enables tank destroyer units to strike at vital objectives, fight on selected terrain, exercise pressure from varied and unexpected directions, and bring massed fire to bear in decisive areas. Tank destroyer units obtain results from rapidity and flexibility of action rather than by building up strongly organized positions. Tank destroyers depend for protection not on armor, but on speed and the use of cover and terrain. When maneuvering in the presence of the enemy they habitually move at the greatest speed permitted by the terrain.²⁸

What would be the relationship between tank destroyers and other friendly combat forces? FM 18—5 specified that tank destroyer elements, like the battalions of *Antitank Defense*, constituted a mobile reserve, not a frontline defense.²⁹ Whether as a battalion attached to a division or a tank destroyer group pooled at the corps echelon or higher (usually three battalions plus elements of the other arms), the tank destroyers' job was to react en masse, in fire-department style, to enemy armored threats anywhere along the line.³⁰ The execution of such a mission required the existence of an armywide tank warning net and demanded road priority for tank destroyer units. FM 18—5 indicated that tank destroyers would actually engage enemy armor in the vicinity of friendly artillery.³¹

FM 18-5 affirmed that such operations would be "semi-independent" and asserted that tank destroyer battalions would of necessity be virtually self-contained units.³² Such self-sufficiency, however, applied only in the face of enemy armor, for "tank destroyers are ill suited to close combat against strong forces of hostile foot troops."³³ When confronted by strong forces of enemy infantry and artillery, tank destroyer companies were actually to be kept to the rear, with only the reconnaissance company maintaining contact. In such situations, tank destroyers would become heavily dependent upon other friendly forces. Therefore, the manual urged that "calls for the assistance of other troops are made without hesitation when tank destroyers are confronted with situations with which they are not designed to cope."³⁴ Although FM 18-5 recommended that the "employment of tank destroyer units should be in close coordination with other troops,"³⁵ it did not spell out how that coordination was to be effected, nor did it clarify how such close coordination was to be reconciled with the tank destroyers' semi-independent mission.

In other words, FM 18-5 underestimated the significance of combined arms, not only as it applied to hostile armored forces, but also to the employment of the tank destroyers themselves. Interaction with the other arms took the form of "coordination," not integration of missions and means. Significantly, the only extensive reference to combined arms to be found in FM 18-5 was a two-page section found near the end of the manual under the chapter on training. It is clear that the formulators of tank destroyer doctrine believed that their special-purpose forces would be able to execute their semi-independent mission under narrowly defined and highly favorable circumstances: they would have thorough and timely intelligence; road priority; advantageous ground behind friendly lines; and an all-tank threat with friendly elements in close proximity, willing to adapt their actions in conformity with the tank destroyer battle.

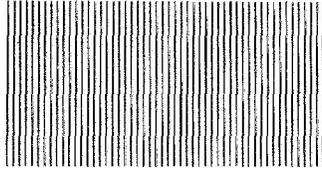

The 76-mm M-18 tank destroyer

The execution of tank destroyer doctrine obviously placed a great deal of reliance on the ability of men and equipment to outmaneuver and outshoot enemy tanks. Early in 1942, when FM 18—5 was being written, most tank destroyer battalions possessed towed antitank guns drawn by standard trucks or half-tracks, even though the favored battalion table of organization called for self-propelled weapons. Bruce (who was promoted to brigadier general on 16 February) decided to adopt self-propelled weapons, even though General McNair continued to favor the towed gun. McNair insisted that the self-propelled gun was too large to be readily concealed, that it would be an unstable firing platform, and that it was less dependable and more expensive than the towed antitank gun.³⁶ Despite McNair's objections, General Marshall favored experiments with self-propelled mounts. McNair acceded, but he was never really reconciled to the self-propelled weapon.³⁷

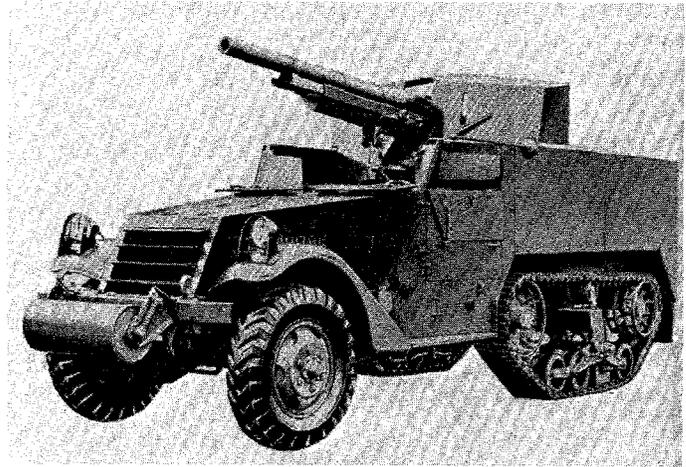

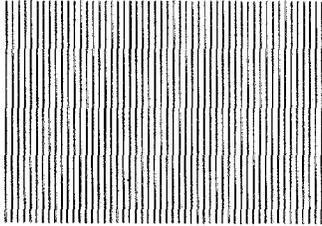

The specifications that Bruce laid down for the ideal tank destroyer weapon were very demanding: simple design, low cost, readily mass-produced, light weight, high mobility, with a three-inch gun to be manned by a crew of five.³⁸ The efforts of the Tank Destroyer Center to have such a design put into production met with resistance from the Ordnance Department, which pushed its own designs regardless of Bruce's requirements. A Special Armored Vehicle Board, chaired by Brigadier General W. B. Palmer, attempted to reconcile such disputes. Palmer noted that the representatives from the Tank Destroyer Center were inflexible in their demands, and that they were possibly asking too much in the requirements they put forth.³⁹

Late in 1942, Bruce obtained approval from the Palmer Board for a tank destroyer design that met his specifications. The new weapon, designed from the ground up to be a tank destroyer, was originally called the T-42. After a number of modifications, which included upgunning the original design significantly, the T-42 was eventually redesignated the T-70, and when accepted for full production, the Gun Motor Carriage M-18. The M-18 could achieve speeds of over fifty miles an hour and weighed less than twenty tons.⁴⁰ It had a ground pressure of only 11.9 pounds per square inch, less than twice that of a man (seven pounds per square inch), which ensured that the M-18 could traverse most of the ground that a foot soldier could.⁴¹ Armed with a powerful 76-mm high-velocity gun, the M-18 was indeed an impressive weapon by 1942 standards. The one drawback to this, the "ideal" tank destroyer, was that it did not enter production until mid-1943.⁴²

In the meantime, the tank destroyer battalions would have to make do with expedient weapons that could be quickly produced and, although far from ideal, would still allow training in tank destroyer doctrine. The first expedient, the M-3 Gun Motor Carriage, was a standard M-3 armored personnel carrier (the half-track) with a World War I-vintage 75-mm field piece mounted on the bed. Of eighty-six M-3s built in 1941, fifty went to the Philippines for use as self-propelled artillery; the remaining thirty-six were used to equip the 93d Antitank Battalion. The M-3 was standard equipment for tank destroyer battalions through 1942.⁴³ Another expedient, the M-6, was a light three-quarter-ton truck with a 37-mm gun mounted in the rear.

The M-3 tank destroyer

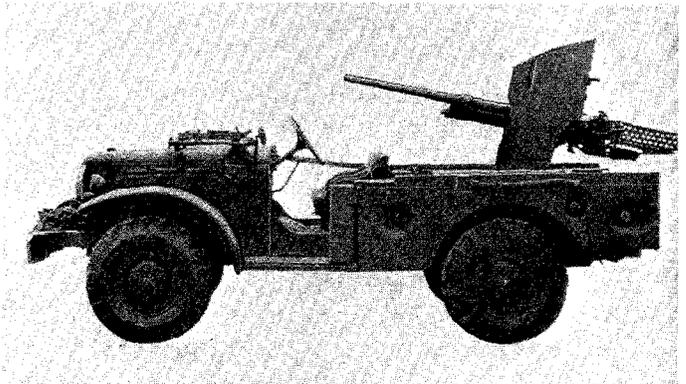

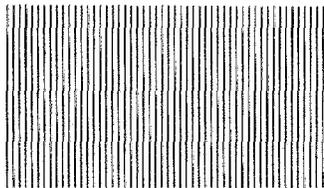

Except for a gun shield, the M-6 had no armor and was intended solely for training purposes. A third expedient, the M-10, is often considered to be the first true tank destroyer (in the sense of the term that denotes a weapons class). The M-10 utilized the chassis of the versatile M-4 medium tank (Sherman), was powered by reliable twin-diesel engines, and mounted an obsolete three-inch anti-aircraft gun in a fully rotating open-topped turret.⁴⁴

General Bruce disliked the expedient weapons, especially the M-10, which he believed was too heavy and slow to execute tank destroyer doctrine. He also feared that a large-scale M-10 production effort would delay the development of the M-18. AGF overruled Bruce's objections in May 1942, ensuring that in 1943 the M-10 would become the principal tank destroyer weapon.⁴⁵

In the midst of writing doctrine and developing equipment specifications, the Tank Destroyer Tactical and Firing Center moved from its original home at Fort Meade, Maryland. Its destination was Killeen, Texas, where the War Department established Camp Hood on 30 January 1942, expressly for the use of the growing tank destroyer establishment.⁴⁶ There the center was redesignated the Tank Destroyer Command on 14 March 1942, but again

The M-6 tank destroyer

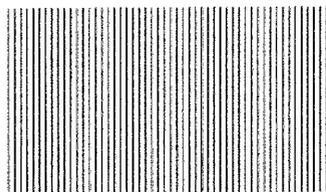

renamed the Tank Destroyer Center on 17 August. Camp Hood became the nexus of all tank destroyer activity, from the training of individuals to the activation of units and the development of doctrine and equipment.⁴⁷

The heart of the Camp Hood establishment was the Unit Training Center, which organized and trained new battalions. It was eventually augmented by an Individual Training Center and a Replacement Training Center that accommodated personnel not yet assigned to battalions. A Tank Destroyer School provided specialized technical training to key officers and men. Eventually Camp Hood also came to include a Tank Destroyer Officer Candidate School. Camp Hood was also home to the Tank Destroyer Board, which wrote doctrine and studied technical matters involving equipment and weapons.

The M-10 tank destroyer

Training at Camp Hood was in large measure driven by the extraordinary emphasis that FM 18—5 placed on the élan and spirit of tank destroyer personnel. The manual called for “the inculcation of courageous but intelligent aggressiveness, the willingness to assume responsibility in the absence of orders, and the exercise of initiative and forethought in making instantaneous decisions to meet any change in any situation.”⁴⁸ Thus, a “major objective of training must be the development of aggressive individuals and units whose skill with weapons have instilled in them confidence in their ability to destroy the enemy both at long range and in close combat.”⁴⁹

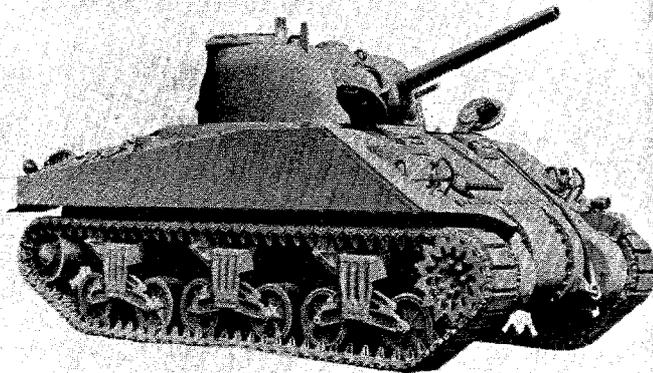

The “close combat” referred to was also discussed in FM 18—5 under the heading, “Dismounted Tank Hunting.” Tank hunting, which was to be conducted by crews from disabled tank destroyers and by the battalion security elements, involved both ambushing tanks on the move and raiding tank parks with small arms, grenades, mines, and improvised weapons.⁵⁰

An important feature of the Camp Hood training facilities was the Tank Hunting Course (later renamed Battle Conditioning), an innovative course designed to acquaint personnel with dismounted combat. Patterned after

courses used in the training of British commandos, the Tank Hunting Course in many ways epitomized the essence of tank destroyer training. It consisted of a simulated battlefield that the trainees negotiated while, for the first time in Army history, live fire grazed overhead. The course included a simulated "Nazi village" complete with surprise targets and traps.

As the course evolved in sophistication, trainees eventually spent a full week on it under battle conditions.⁵¹ Excellent gunnery ranges and vast areas of open ground facilitated the training of tank destroyer personnel and units in the more conventional antitank skills.

By World War II standards, the training program at Camp Hood ranked with the best. The camp grew into an enormous complex that at its peak had twenty-eight battalions and eight groups in training at one time. Although other branches of the Army were using some of the facilities by the end of the war, Camp Hood remained the focal point of tank destroyer development and training.

The M-4 Sherman tank, which provided the chassis for the M-10 tank destroyer

However, even as the first tank destroyer units underwent preparations for their first trial by combat, some serious problems within the tank destroyer establishment were becoming manifest. One of these was the relatively unproven status of tank destroyer doctrine. FM 18-5 had been hurriedly produced at Camp Hood in relative isolation from the rest of the Army. Neither the full doctrine nor the newer self-propelled weapons had ever undergone large-scale maneuvers in conjunction with the other arms.

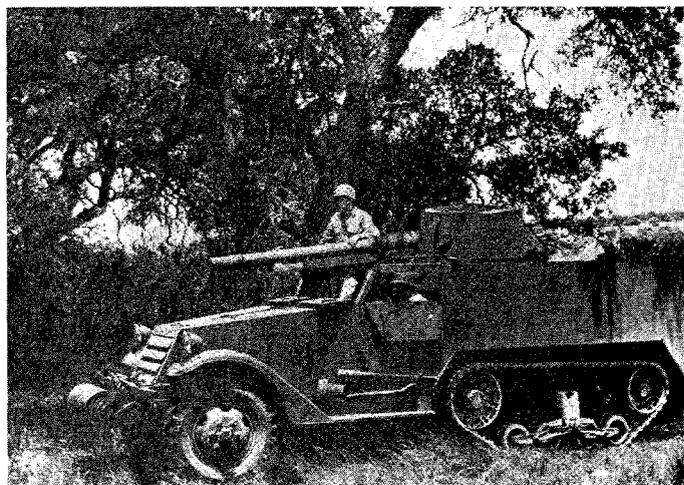

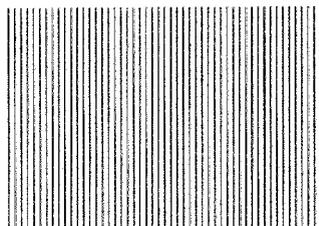

Furthermore, General Bruce himself was dissatisfied with at least one major aspect of tank destroyer doctrine. On 7 January 1942 and again on 2 June, he unsuccessfully recommended to McNair that a tank destroyer battalion be made an organic element of each division and that all battalions in a reserve status be assigned specifically to some command.⁵² Bruce feared that under the loose attachment and pooling policies favored by General McNair that tank destroyer units would be preyed upon for replace-

ments for the line units. On the other hand, if tank destroyers were an integral part of the division or corps, Bruce felt that it would be in the better interests of the higher commanders to protect the integrity of tank destroyer units.⁵³

Another problem that marred the tank destroyer program in its infancy was the abbreviated training time that some of the early battalions received. AGF timetables dictated that several battalions undergo as little as seven weeks of training before being shipped out for North Africa, rather than the two to three months normally allotted to unit training. Consequently, even some of the best trained of the tank destroyer personnel had reservations about their qualifications for combat. In addition, the deliberate cultivation of elan was not equally successful in all individuals, and some trainees questioned the value of such melodramatic and dangerous aspects of tank destroyer doctrine as dismounted tank hunting.⁵⁴

The M-3 tank destroyer during training

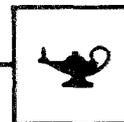

Much of the weaponry that the tank destroyer units employed in their combat initiation was expedient equipment that would make the execution of doctrine even harder. The M-6 was virtually unarmored, badly undergunned, and was never intended for combat, but it saw action in North Africa. The M-3 was little better, especially considering that the poorly armored and armed half-track would be engaging some of the world's best tanks.⁵⁵ General Bruce disliked the M-10, even though it was by far the best of the expedient weapons.

The most serious problem facing the tank destroyers in 1942 was the unpleasant fact that they were joining an Army that was largely ignorant of tank destroyer doctrine. A radio warning net, road priority, and coordination with other arms were vital to the tank destroyer mission, but all of these factors depended upon higher commanders who were poorly informed, if not wholly misinformed, about tank destroyers. To correct this situation,

General Bruce held the first of a series of indoctrination courses for generals and general staff officers on 30 November 1942—three weeks after Operation Torch began and eight days after the first tank destroyer battalion entered combat in North Africa.⁵⁶

Tank Destroyers Under Fire

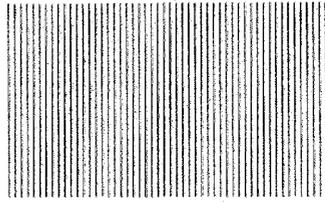

3

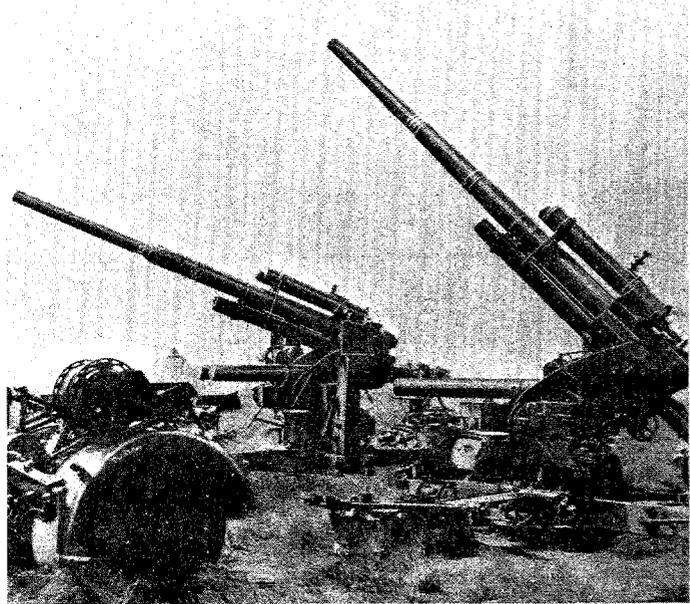

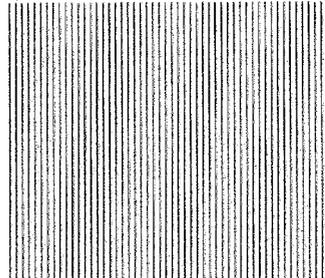

The war that awaited the U.S. Army in North Africa did not lend itself to the successful implementation of tank destroyer doctrine. The tank destroyer concept arose from a perceived need to counter the blitzkrieg, but in North Africa, the Allies, not the Axis, held the initiative. Moreover, tank destroyers discovered that German panzer doctrine bore little relationship to the headstrong tank tactics described in FM 18-5.

The most outstanding characteristic of German armored doctrine was the close integration of tanks, antitank guns, infantry, artillery, and aircraft into a combined arms team. As the British Eighth Army had already learned at great cost, German tanks almost invariably operated under the protective fire of a superb antitank screen. Typically, fearsome 88-mm antiaircraft-antitank guns, flanked by lighter pieces and protected by infantry, covered all German tank movements from concealed overwatch positions. Even when on the offensive, the Germans made every effort to support tank elements with antitank and artillery pieces. The British veterans knew well what the Americans were to learn: any attempt by tanks (or tank destroyers) to attack German mechanized elements, even those that appeared to be isolated and vulnerable, was likely to bring down a murderous converging fire from concealed antitank guns. Any Allied attack that did not provide for the neutralization of this antitank defense risked defeat and disaster.¹

The tank destroyers would even find it difficult to stand on the defensive and ambush attacking German armor, for German tanks rarely attacked blindly or recklessly. An American armored officer reported that "when the German tanks come out, they stay out of range and sit and watch. Then they move a little, stop, and watch some more. They have excellent glasses [binoculars] and they use them carefully. They always seem to make sure of what they are going to do and where they are going before they move . . ." ² Major General Orlando Ward, commander of the 1st Armored Division in Tunisia, remarked that advancing German tanks sometimes moved so slowly that it was necessary for the observer to line up the German vehicles against a terrain feature in order to be sure that they were moving at all.³

The German dual-purpose
88-mm antiaircraft-antitank
gun

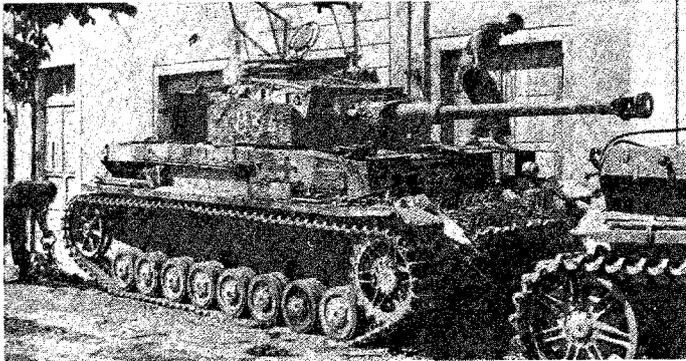

Typically, German tanks in the attack enjoyed the close cooperation of the other arms. Not only did the advancing panzers endeavor to bring their antitank screen and supporting artillery with them, but infantry would also be available to reconnoiter minefields and assist the tanks in utilizing every available terrain feature. The actual tank assault involved the support of artillery, infantry, and aircraft that helped neutralize the defender's antitank guns and create gaps in his defenses.⁴

Thus, the tank destroyers would find themselves at an immediate disadvantage. Their doctrine, force structuring, and weaponry prepared them to deal exclusively with tanks. In North Africa, the battle was not tank destroyer against tank but tank destroyer against an integrated, combined arms force conducting a skillful defense.

The qualitative superiority of German weaponry made it even harder for tank destroyers to execute their mission. FM 18-5 implied that tank destroyers would enjoy a significant superiority in firepower over enemy armor. By 1943, however, the German arsenal included the Mark IV panzer, mounting a long-barreled, high-velocity 75-mm gun that fired a tungsten carbide antitank round, and the massive Mark VI Tiger tank, which carried a version of the deadly 88-mm gun. By comparison, the expedient M-3 tank destroyer mounted a 75-mm gun (originally designed in 1897) that was not really an antitank gun at all. With a maximum armor thickness of .625 inches, the M-3 was terribly vulnerable to all but small-arms fire.⁵ The M-6 was much worse. In the words of an AGF observer, "The sending of such a patently inadequate destroyer into combat can at best be termed a tragic mistake."⁶ Its only armor was a .25-inch gun shield. The gun itself was the 37-mm antitank piece that FM 18-5 said was effective to a range of five

hundred yards.⁷ In practice, the 37-mm was effective only against the sides and rears of most tanks, and that at under four hundred yards.⁸ One 37-mm gun of the 601st Tank Destroyer Battalion scored five hits on a German Mark IV at one thousand yards with no observed effect.⁹ Against the Tiger, 37-mm guns were ineffective at virtually any range.

A captured Mark IV panzer mounting the high-velocity 75-mm gun

Significantly, the organic antitank gun of the U.S. infantry division was the same inadequate 37-mm weapon. Tank destroyer doctrine assumed that the infantry would be capable of basic self-defense against tanks so that tank destroyers could be kept back in reserve. In 1942 and 1943, organic antitank defense in the infantry division consisted of an antitank company in each regiment, plus a platoon in each rifle battalion, all armed with the 37-mm gun. Infantry antitank gunners reported that the towed 37-mm was truly effective against tanks only if perfectly camouflaged and fired at point-blank range.¹⁰ A hollow-charge, rocket-propelled antitank grenade (the bazooka) became available in the middle of the Tunisian campaign, but this, too, was a short-range weapon, and the infantry had no training in its use. Tanks and tank destroyers would be pressed into frontline defense to help protect the infantry from tanks, in direct contradiction to the doctrine of both arms.

American forces attained a semblance of qualitative parity with the Germans in antitank firepower late in the Tunisian campaign with the advent of the M-10 tank destroyer. This weapon, with its three-inch, high-velocity gun, fully rotating turret, and robust tank chassis was indeed an excellent weapon by 1943 standards.¹¹ The similarly armed M-18, which first saw combat in Italy, was also a welcome addition to the arsenal. Events would prove, however, that even when armed with adequate weapons, the tank destroyers could do little to alter the tactical and strategic circumstances that militated against their employment in accordance with doctrine. The division commanders at the front could hardly be expected to allow the thirty-six self-propelled guns of each tank destroyer battalion to lay idle simply because battlefield realities did not conform with FM 18-5. Thus, the stage was set for wide-scale misemployment of tank destroyers.

A total of seven tank destroyer battalions participated in the North African campaign, which began on 8 November 1942 with Allied landings in Morocco and Algeria and ended in May 1943 with the capture of Tunis and Bizerte in Tunisia. Two battalions, the 601st and 701st, were the only ones to see action until mid-February. These units were originally drawn from the 1st Infantry and 1st Armored Divisions, respectively. They were organized under the 8 June 1942 tables (one of the three platoons in each company being a light platoon) and were equipped with the M-3 and M-6 weapons.

The honor of being the first tank destroyer battalion to see combat fell to the 701st. On 22 November 1942, Company B of the 701st, with a reconnaissance platoon attached, arrived in Feriana, Tunisia, after a six-day road march. At Feriana, the company commander received orders to assault and capture the town of Gafsa, a mission completely at variance with tank destroyer doctrine. Company B approached the task without infantry or artillery support and in the "absolute absence of any information on the enemy forces."¹² Upon reaching Gafsa, the company's two M-3 platoons deployed and shot their way into the town. (The company commander wisely kept his platoon of M-6s in reserve.) Surprisingly, the attack succeeded without loss. The M-3s pushed on and managed to ambush a body of enemy tanks at nearby El Guettar, destroying four without losing an M-3. On the next day, Company B drove the enemy out of Sbeitla in a similar operation, destroying eleven Axis tanks in the process. The company commander attributed this feat to "our boldness [that] was matched only by the enemy's utter disregard for the remotest pretense of local security."¹³

In these first three tank destroyer actions, Company B took 400 prisoners and claimed fifteen enemy tanks destroyed.¹⁴ Back at Camp Hood, instructors at the tank destroyer school passed this account on to their students but accompanied it with a warning: "Do not expect to use your tank destroyers in this manner and succeed in a majority of cases."¹⁵

The curious engagements at Gafsa and Sbeitla were an encouraging initiation to combat, but they did little to test the capabilities of tank destroyers in their primary mission. Such an opportunity arose between 14 and 22 February 1943 in the course of a German counteroffensive known generally as the battle of Kasserine Pass. Along with other elements in the U.S. Army, the tank destroyers were found wanting.

Like most U.S. units in Tunisia, the tank destroyer battalions involved in the Kasserine battle were fragmented and dispersed. The 601st and 701st Tank Destroyer Battalions, still scattered about in companies and by now understrength due to attrition, were thrashed piecemeal by Field Marshal Erwin Rommel's veterans of the Libyan desert. The initial 14 February assault of the 10th and 21st Panzer Divisions at Sidi-bou-Zid swept away Company A, 701st Tank Destroyer Battalion, along with Combat Command A, 1st Armored Division.¹⁶ On the following day, Company C of the 701st joined the 1st Armored Division's Combat Command C in an incredibly ill-conceived counterattack aimed at recapturing the Sidi-bou-Zid position and was badly battered in the ensuing German ambush.¹⁷

A damaged Mark VI Tiger tank being inspected by U.S. troops

Elements of the 601st, numbering less than a company, participated in the defense of Sbeitla on 16 February. The tank destroyers were placed in advance of the main defensive position held by Combat Command B, 1st Armored Division. They managed to fire effectively for a while against probing German tanks. Soon, however, German fire proved to be too much for the men of the tank destroyer security sections, who retreated precipitately in their unarmored vehicles. The sight of fleeing security troops unnerved and demoralized the crews of the M-3s. When the tank destroyers attempted to maneuver to new positions under fire, they lost cohesion and were routed.¹⁸

Although the tank destroyers proved to be unequal to the task of stopping German armor in the open, they eventually did make some important contributions towards staving off Rommel's attack. On 21–22 February, the combined fire of tanks, artillery, and elements of the 601st and 894th Tank Destroyer Battalions halted the westward Axis thrust at Djebel el Hamra.¹⁹

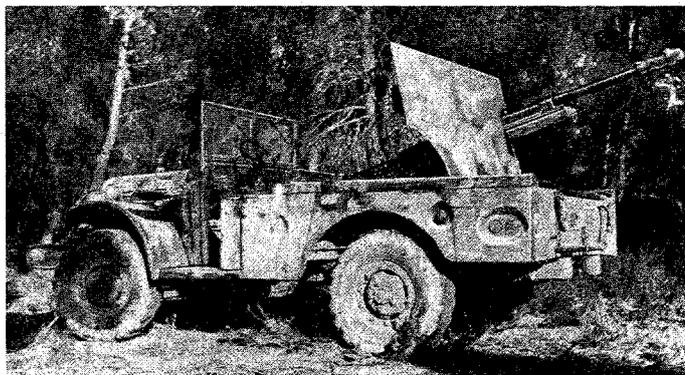

One month after Kasserine, enemy tanks challenged an intact tank destroyer battalion for the first time. The action took place at El Guettar, where the 601st stood in defense of the 1st Infantry Division's communications and artillery. Except for friendly artillery, the tank destroyers were unsupported. On 23 March, about fifty tanks of the 10th Panzer Division attacked the 601st, which still used the expedient M-3 weapon. A company of the 899th Tank Destroyer Battalion, equipped with M-10s, advanced to reinforce the 601st but was slow in arriving due to traffic and minefields. The tank destroyers, employing the fire-and-movement tactics prescribed by

doctrine, turned back the Axis attack and accounted for a reported thirty enemy tanks destroyed. But the victory was dearly bought—about twenty of the twenty-eight M-3s engaged, plus seven of the new M-10s, were lost.²⁰

The costly victory at El Guettar stands alone as the only engagement of the North African and Italian campaigns in which a united tank destroyer battalion met and stopped a concerted tank attack. In fact, it was increasingly rare for tank destroyer battalions to be held back in antitank reserve. Battalion commanders noted that the concept “whereby tank destroyer units sat in rear areas awaiting sudden commitment to violent tank action [was] psychologically unsound.” Experience showed that if tank destroyers were not on hand when the enemy tank attack started, they were unlikely to arrive in time to influence the outcome.²¹ Moreover, attempts to bring the large tank destroyer weapons forward through established positions frequently resulted in the inadvertent destruction of communication wires.²²

An M-6 tank destroyer in North Africa

Rather than holding the tank destroyers in reserve, higher commanders in North Africa and Italy tended to distribute tank destroyer battalions to the divisions, where they served to bolster the infantry's inadequate organic antitank defenses. Once attached to a division, the tank destroyer battalion was almost invariably fragmented into companies or even platoons. Reportedly, there was at least one instance of tank destroyers in Tunisia being parceled out singly to rifle platoons.²³ During the Anzio battle in Italy, two tank destroyer platoons were attached to an independent tank battalion that was, in turn, attached to the 45th Division.²⁴

Such dispersal proved to be an administrative nightmare. In theory, the flow of logistics for tank destroyer units passed from field army or corps, through the tank destroyer battalion headquarters, to the fighting companies and platoons. In practice, isolated tank destroyer elements often found it difficult to procure such basics as hot food and dental care²⁵ because neither army, corps, nor battalion could keep track of them. One tank destroyer unit is reported to have requested fuel and ammunition from the division it was attached to and to have received gasoline and 75-mm shells

in return. Unfortunately, the M-10 tank destroyer used diesel fuel and three-inch ammunition.²⁶

The personnel and maintenance requirements of "orphaned" tank destroyer units frequently went unfulfilled, and weaknesses in leadership often went undetected or uncorrected. All of these problems stemmed from the same cause: tank destroyer elements were not organic to any command, hence no command felt constrained to look after their well-being. Shifting tank destroyer elements from one division to another exacerbated such problems and disrupted the development of tank destroyer teamwork with the other arms, a relationship that was vital to their success on the battlefield.²⁷

Typically, tank destroyer companies and platoons attached to infantry formations were sent to the front to supplement the inadequate antitank guns and bazookas of the infantry regiment. With the exception of increasingly rare armored counterthrusts, German tanks, on their part, tended to operate in small numbers and in conjunction with infantry forces, thus making it necessary for tank destroyers to cover wide sections of the front.²⁸ Like all large weapons, tank destroyers tended to draw enemy artillery fire, making it necessary to dig them into positions located away from the infantry, very often on unfavorable ground.²⁹ Tank destroyer crews learned the importance of digging good positions, concealing their weapons carefully, and holding fire until enemy tanks came into effective range.³⁰ Such techniques were more akin to the antitank methods of the Germans and the British than they were to prescribed tank destroyer doctrine. FM 18-5 described tank destroyer action as often taking place after enemy tanks broke through friendly lines,³¹ but according to Major General E. M. Harmon, armored division commander in North Africa and Italy, "It is a fixed rule and a point of honor that neither our tanks or tank destroyers will permit their infantry to be overrun by hostile tanks, no matter what it costs to themselves."³²

Clearly, the battlefield commanders in Tunisia and Italy contravened the most basic principles of tank destroyer doctrine. Instead of maintaining a tank destroyer reserve for defense-in-depth against massed enemy armor, commanders employed tank destroyers in a frontline cordon defense. Considering the diffuse nature of the Axis armored threat, such employment made sense. Adherence to FM 18-5 did not.

Although tank destroyer doctrine held little utility in North Africa and Italy, this is not to suggest that the tank destroyers themselves were useless. In addition to contributing significantly to frontline antitank firepower, tank destroyer battalions, on their own, developed new missions that were not to be found in FM 18-5. The battalion that pioneered the development of secondary missions was apparently the 776th, commanded by Lieutenant Colonel James P. Barney. Barney, like many other tank destroyer officers, was an artilleryman. (Of the traditional arms, Field Artillery felt the closest kinship to the fledgling tank destroyers.) As a gunner, his instincts rebelled at the thought of leaving the battalion's thirty-six tubes idle in the absence

of an enemy tank threat. To provide employment for his battalion, Barney worked out techniques and procedures for using tank destroyers as indirect-fire artillery in support of the howitzers of division artillery. Other battalions were quick to emulate the 776th.

Barney divided his three companies into two six-gun batteries, rather than the three four-gun platoons specified in the tables of organization. This restructuring freed some platoon officers to act as observers and produced a battery with approximately the same firepower as a standard battery of four 105-mm howitzers.³³ He then placed each company in support of an artillery battalion. The tank destroyer companies commonly operated their own fire direction centers but, lacking sophisticated equipment, relied on division artillery to help with surveys.³⁴

The thirty-six three-inch guns mounted on Barney's M-10s equaled the number of tubes found in three field artillery battalions. Moreover, the three-inch weapons complemented the 105-mm howitzers nicely. They could reach out to fourteen thousand yards—four thousand yards farther than the 105-mm.³⁵ The three-inch weapon was very accurate, and its shell arrived on target with little warning. The burst radius of the three-inch shell was about equal to that of the 105-mm, but its instantaneous burst reduced the amount of cratering sustained by roads in the path of friendly forces. Moreover, three-inch rounds were cheaper and, being smaller, easier to transport than 105-mm shells. These qualities made the three-inch tank destroyer gun ideal for long-range harassment and interdiction, freeing the artillery's howitzers for close-range missions requiring heavier metal.³⁶

The fully tracked M-10 was itself a good gun mount. The tank destroyers could displace and occupy new positions with a minimum of site preparation. Especially when dug in and provided with an improvised turret cover, the M-10 was relatively immune to counterbattery fire. Moreover, the M-10s sought out reverse slopes as artillery positions (to supplement the elevation of the gun), leaving the level ground for towed artillery.³⁷ In Italy, it was discovered that the M-10 could tow a 105-mm howitzer during displacements, freeing the howitzer's prime mover to haul ammunition and supplies.³⁸

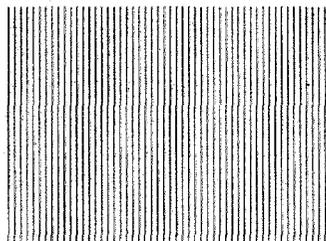

But the employment of tank destroyers as reinforcing artillery was not without its drawbacks. Constant firing wore out the high-velocity tubes relatively quickly.³⁹ Although tank destroyers maintained a basic load of antitank ammunition even when serving as artillery, the secondary mission, nonetheless, interfered with their ability to train for the antitank role. Some battalions split their companies between artillery and antitank missions to maintain a degree of antitank readiness.⁴⁰ These drawbacks notwithstanding, battalion commanders agreed that morale improved when tank destroyers were employed in meaningful missions all the time, be they antitank or artillery.⁴¹

Barney's 776th Tank Destroyer Battalion discovered that when placed well forward in the lines, tank destroyers could fulfill another valuable secondary mission—that of direct-support artillery. Late in the Tunisian campaign, the 776th found itself in support of an attacking tank unit. Prior

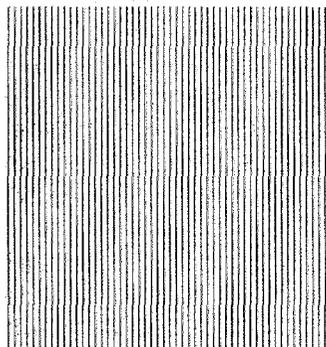

to the armored assault, the tank destroyers methodically shot up all potential German defensive positions with their powerful three-inch guns. The tanks attacked without loss to antitank guns and discovered that the German defenses had been thoroughly demolished by the destroyers' fire. The 776th built upon this experience and developed a leapfrog technique that allowed the tank destroyers to maintain continuous direct-fire support for advancing friendly elements.⁴²

The direct-fire mission was especially important in Italy, where tank destroyers provided covering fire for tanks that, being better armored, closed with and destroyed enemy positions impeding the advance of the foot soldiers. Thus, tank destroyers supported tanks, and tanks supported infantry. During the September 1944 assault on the Gothic Line, specially trained tank destroyer gunners supported the advance by placing rounds through the small gun embrasures of German pillboxes at a range of fifteen hundred yards. Even when openings could not be hit, the high-velocity rounds were quite effective against concrete fortifications.⁴³ Tank destroyers were so valuable as armored self-propelled assault guns that one battalion in Italy functioned exclusively in the direct-support role for four months.⁴⁴

Ironically, the Tank Destroyer Center at Camp Hood had suggested the use of tank destroyers against fortifications in 1942 but had backed off when accused of overselling the tank destroyer product.⁴⁵ The secondary artillery roles, which were developed entirely by units in the combat theaters, proved to be so successful that early in 1943, AGF directed the Unit Training Center at Camp Hood to institute supplemental training in indirect laying.⁴⁶

M-10 tank destroyer in Italy

The successes attained in secondary roles did not, however, counteract a growing dissatisfaction with the tank destroyer program as a whole. Commanders at division and lower echelons welcomed the tank destroyers for their versatility and firepower, but higher commanders, as a rule, never reconciled themselves with the concept of an aggressive, offensive antitank arm. According to FM 18-5, "offensive" tank destroyer action took the form of attacking tanks by fire, not by engaging them in "slugging matches."⁴⁷ This distinction was too fine, if not downright ambiguous—especially for a field manual. Higher commanders were not alone in failing to differentiate between "offensive action" and "slugging matches," for there were instances in Tunisia of tank destroyers actually charging enemy tanks.⁴⁸

On 21 March 1943, Allied Forces Headquarters (AFHQ—General Eisenhower's theater headquarters for North Africa) issued a training memo that sought to tone down the aggressive orientation of tank destroyer doctrine:

While it is true that tank destroyer battalions constitute a mobile reserve of antimechanized fire power with which to meet a hostile tank attack, numerous encounters have shown that their characteristics are such as to prohibit their use offensively, either to seek out the hostile tanks in advance of our lines or to meet and shoot it out with them in the open

The statement in FM 18-5 that they are designed for offensive action will not be construed to the contrary.⁴⁹

Major Allerton Cushman, an observer for AGF and the Tank Destroyer Center who witnessed the Tunisian operation firsthand from December 1942 to March 1943, filed a report bearing similar conclusions. He stated that the M-3 and M-10 tank destroyers

can not be used offensively to seek out enemy tanks in advance of our lines or to engage in "slugging" matches with them in the open. Any attempt to do so will subject them to destruction by the enemy's AT guns, against which their flat trajectory fire is ineffective.⁵⁰

Troops in Africa have found that the best way to meet a German tank attack is from concealed, dug-in positions with routes reconnoitered to alternate firing positions.⁵¹

Tank hunting, i.e., dismounted men going out after tanks with sticky grenades, Molotov cocktails, etc., is fine in theory but is considered ridiculous by troops who are in actual war.⁵²

Significantly, Cushman found no requirement for a high-speed tank destroyer. He noted that cross-country mobility counted for much more than road speed because the speed of a particular vehicle was seldom reflected by the speed of the unit to which it belonged. Cushman considered the M-10 to be a fine weapon, combining excellent firepower and cross-country mobility with adequate armor protection.⁵³

Although both AFHQ and Major Cushman faulted tank destroyer doctrine primarily for its overemphasis on aggressiveness, other officers who took at face value FM 18-5's call for "offensive action" condemned the entire tank destroyer concept. Major General John P. Lucas, a friend of

General Jacob L. Devers

McNair's and Marshall's special observer in Tunisia, reported that "*the Tank Destroyer has, in my opinion, failed to prove its usefulness [sic] . . . I believe that the doctrine of an offensive weapon to 'slug it out' with the tank is unsound.*" In place of the M-10, he called for a "purely defensive" weapon.⁵⁴ All three men who commanded the U.S. II Corps in Tunisia, Major Generals Lloyd R. Fredendall, George S. Patton, and Omar N. Bradley, expressed their dissatisfaction with the aggressive, self-propelled tank destroyer.⁵⁵

General Harmon, who commanded the 2d Armored Division in North Africa, stated flatly that "there is no need for tank destroyers. I believe the whole organization [and] development of the tank destroyer will be a great mistake of the war. Had more powerful guns been installed in American tanks, tank destroyers would have been unnecessary."⁵⁶ Lieutenant General Jacob L. Devers, chief of the Armored Force, who toured North Africa in the winter of 1942—43 (and who would one day command AGF), agreed: "The separate tank destroyer arm is not a practical concept on the battlefield. Defensive antitank weapons are essentially artillery. Offensively the weapon to beat the tank is a better tank."⁵⁷

Even the Chief of Staff, General Marshall, who had played a major role in instigating the tank destroyer program, was dissatisfied. His complaint centered on training, rather than doctrine. While in North Africa for the Casablanca Conference of January 1943, he came across a tank destroyer

battalion in such a low state of readiness that he was moved to fire off a direct reprimand to General Bruce:

What I want to draw to your personal attention is that this unit displayed a lack of disciplinary leadership and training that was glaring and meant that it was not useable for any battle against the Germans until it had been reconstituted. The men were all right, the training was seriously wrong . . . this is the second time there has come to my attention a deficiency in the ordinary fundamentals of discipline in Tank Destroyer units . . . Such procedure is unacceptable to me . . . From a superficial point of view it would appear that you have concentrated too much on tactics and technique in comparison with the attention you are giving the fundamentals of discipline.⁵⁸

Bruce satisfied himself that the major fault of the battalion in question was its commander, not its training.⁵⁹ However, Bruce's onetime chief of staff agreed with Marshall that training at Camp Hood overemphasized technical training at the expense of discipline.⁶⁰ Furthermore, observers reported that tank destroyers, in common with many other elements in the Army, received insufficient training in combined arms prior to combat. This was particularly true for the training conducted at Camp Hood, for it was AGF policy to stress branch training, rather than combined arms training, in the new elements such as armored, tank destroyer, and antiaircraft artillery.⁶¹

The adverse reports that bombarded Washington and Camp Hood in 1943 contributed to a sharp decline in the power and influence of the tank destroyer establishment. The actual status of the tank destroyers within the Army had never been closely defined, thus the tank destroyer program was particularly vulnerable to the negative recommendations that emanated from officers of high rank and combat experience.

In fact, the institutional status of the tank destroyers had begun to slip even before the North African campaign. The redesignation of the Tank Destroyer Command as the Tank Destroyer Center in August 1942 reflected a sharp restriction of authority. As a center, the tank destroyer facility at Camp Hood was strictly a training establishment, meaning that General Bruce's authority extended no farther than the boundaries of the post. Once a tank destroyer battalion was trained and delivered to a tactical headquarters, it ceased to have any formal connection with the Tank Destroyer Center.⁶²

The center itself began to close down some of its training activities as early as October 1943 because the demand for tank destroyers in the theaters of operations was much lower than had been anticipated. In 1941, Bruce had projected an eventual establishment of 220 battalions,⁶³ but the troop basis for 1943 called for only 144.⁶⁴ In the event, only 106 tank destroyer battalions were active by the end of 1943, but even these exceeded demand. Sixty-one battalions participated in the European war, ten sailed to the Pacific theaters, but thirty-five never shipped out at all,⁶⁵ having been "rendered surplus by the changing pattern of the war."⁶⁶ Eleven of the thirty-

five were redesignated as armored field artillery, amphibious tractor, or tank battalions. The remainder were eventually inactivated or broken up for their manpower.⁶⁷

The surviving tank destroyer battalions were much smaller than the original battalions activated in 1942. To alleviate shipping problems, and later a manpower shortage, AGF enforced a policy of reducing the manpower and motor transport in all units.⁶⁸ A new tank destroyer table of organization, approved on 27 January 1943, called for 673 men, down from 898. The reduction was accomplished by eliminating the antiaircraft section in each platoon (in accordance with combat experience),⁶⁹ combing out administrative and support troops, and combining the nine-man platoon headquarters with the twelve-man security section to form a twelve-man headquarters and security section.⁷⁰ Thus, the tank destroyer battalion underwent a manpower reduction of about 25 percent without surrendering any antitank tubes (see figure 7).

As the tank destroyer establishment declined in status and size, it had to fend off attempts to consolidate its diminished functions with those of the other arms. In 1942, General Devers of the Armored Force made an unsuccessful bid to take over tank destroyer training activities. In the fol-

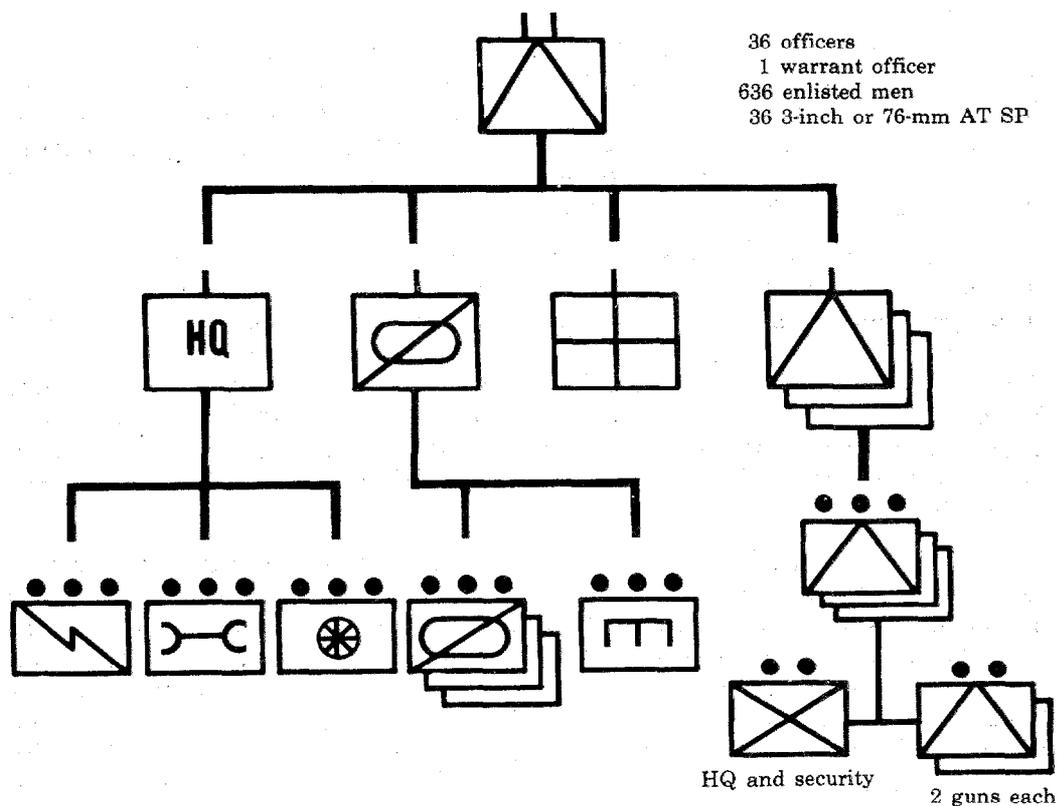

Figure 7. Tank destroyer battalion (SP), 1943
